§ SSPPS

General Procedures. HPLC grade solvent used for purification of sub-micromole samples was redistilled from glass. CD spectra were recorded on a Jasco J 810 spectropolarimeter in 0.1 cm quartz cells at $23{ }^{\circ} \mathrm{C}$ unless otherwise stated. UV-Vis spectra were recorded in a dual beam Jasco V630 spectrometer in 0.1 cm quartz cells. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C} \mathrm{NMR}$ spectra were recorded in $\mathrm{CDCl}_{3}(99.8 / \% \mathrm{D})$ using either a Varian Mercury-400 ( 400 MHz ), Varian Unity-500 (500 MHz), Bruker DMX-600 (600 MHz ) equipped with a $1.7-\mathrm{mm}\left\{{ }^{13} \mathrm{C}\right\}^{1} \mathrm{H}$ cryoprobe (Bruker 1.7 mm CPTCI probe). NMR spectra were measured in $\mathrm{CDCl}_{3}$ and referenced to residual solvent signals ( ${ }^{1} \mathrm{H}, \delta 7.26 \mathrm{ppm} ;{ }^{13} \mathrm{C}, \delta 77.16 \mathrm{ppm}$ ). IR spectra were recorded using attenuated total reflectance (ATR, 3 mm ZnSe plate) with a Jasco 4100 FTIR on samples deposited as thin films. LR LCMS was carried out on a ThermoFisher Accela UPLC coupled to an MSQ single quadrupole mass spectrometer operating in positive ion mode, unless otherwise stated. HRMS measurements were measured at the Scripps Research Institute (TOF-MS or ICR-FTMS) mass spectrometry facility. Semi-preparative HPLC was carried out on a Varian SD200 system equipped with a dual-pump and UV-1 detector (variable $\lambda$ 's) under specified conditions.

Isolation of 1. The sponge Phorbas sp. (sample ID: 93-054) was collected at -10 m by scuba near Muiron Island, Western Australia in 1993. The single specimen was immediately frozen and stored at $20{ }^{\circ} \mathrm{C}$ until extraction ( $\sim 2$ months). The $\mathrm{CCl}_{4}$-soluble fraction (93-054-B-1, 350 mg ) of the MeOH extract ${ }^{1}$ was separated by flash chromatography (silica cartridge, Analogix RS-12, $12 \mathrm{~g}, 2 \mathrm{~cm} \times 7.5 \mathrm{~cm}$ ) and elution by step-gradient of solvent ( $0-100 \%$ EtOAc in hexane) to yield seven fractions. Fraction 5 (93-054-B1-5, 12.5 mg ) was further purified twice by reversed phase HPLC (Phenylhexyl column, 250 $\times 10 \mathrm{~mm}, 1: 9 \mathrm{H}_{2} \mathrm{O}-\mathrm{MeOH}$, followed by Phenylhexyl column, $250 \times 4.6 \mathrm{~mm}, 2: 3 \mathrm{H}_{2} \mathrm{O}-\mathrm{CH}_{3} \mathrm{CN}$ ) to yield pure $1\left(t_{\mathrm{R}}=34 \mathrm{~min}\right), 90 \mu \mathrm{~g}$ (yield $=4.1 \times 10^{-5} \%$ dry weight of sponge). The yield was calculated using NMR quantitation by solvent ${ }^{13} \mathrm{C}$-satellites (QSCS). ${ }^{2}$

[^0]( $\pm$ )-1,1,1-trichloro-4-phenylbutan-2-yl hexanoate, 4. A solution of
 ( $\pm$ )-1,1,1-trichloro-4-phenylbutan-2-ol $(130 \mathrm{mg}, \quad 0.516 \mathrm{mmol}$, prepared from hydrocinnamaldehyde, $\mathrm{Cl}_{3} \mathrm{COOH}$ and $\mathrm{Cl}_{3} \mathrm{COONa}$ in $\mathrm{DMF}^{3}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was treated with DMAP ( $63 \mathrm{mg}, 0.516$ $\mathrm{mmol})$ and DCC ( $106.7 \mathrm{mg}, 0.516 \mathrm{mmol}$ ) and the mixture stirred for 5 min . Hexanoic acid ( 72.2 mg , 0.621 mmol ) was added and the mixture stirred at r.t. under $\mathrm{N}_{2}$ until TLC indicated completion of the reaction (3 h). The solvent was removed under reduced pressure and the solid residue was dissolved in EtOAc ( 10 mL ) and chilled at $0^{\circ} \mathrm{C}$ for 10 min whereupon a colorless solid precipitated. The solid was removed by filtration and the supernatant washed with sat. $\mathrm{NH}_{4} \mathrm{Cl}(3 \times 6 \mathrm{~mL})$ and sat. $\mathrm{NaCl}(3 \times 4 \mathrm{~mL})$. The organic layer was passed through a short column of anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the filtrate was concentrated under reduced pressure to give a crude product which was purified by flash chromatography (silica, 2:3 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane) to give ( $\pm$ )-4 (71.6 $\mathrm{mg}, 72 \%$ ) as a colorless oil. FTIR (ATR): v 2956, 2933, 2861, 1751, 1496, 1455, 1372, 1265, 1222, 1148, 1093, 785, 735, $699 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.28 \mathrm{~m}(2 \mathrm{H}), 7.24 \mathrm{~m}(4 \mathrm{H}), 5.57(\mathrm{dd}, J=10.3,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.70 \mathrm{~m}(1 \mathrm{H})$, $2.47 \mathrm{~m}(1 \mathrm{H}), 2.41 \mathrm{~m}(1 \mathrm{H}), 2.21 \mathrm{~m}(1 \mathrm{H}), 1.70 \mathrm{~m}(1 \mathrm{H}), 1.35 \mathrm{~m}(1 \mathrm{H}), 0.92(\mathrm{t}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 172.6(\mathrm{C}), 140.4(\mathrm{CH}), 128.7(\mathrm{CH}), 128.5(\mathrm{CH}), 126.5(\mathrm{CH}), 100.1(\mathrm{C}), 80.3(\mathrm{C})$, $34.1\left(\mathrm{CH}_{2}\right)$, $32.4\left(\mathrm{CH}_{2}\right)$, $31.9\left(\mathrm{CH}_{2}\right)$, $31.4\left(\mathrm{CH}_{2}\right)$, $24.5\left(\mathrm{CH}_{2}\right)$, $22.4\left(\mathrm{CH}_{2}\right)$, $14.0\left(\mathrm{CH}_{3}\right)$. HREIMS $m / z$ $373.0503[\mathrm{M}+\mathrm{Na}]^{+}$; calc. 373.0499 for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{Cl}_{3} \mathrm{O}_{2} \mathrm{Na}$.

## Preparation of (2-Chloro-1-cyclopropyl)-3-hydroxypropanoate esters, 6a and 6b

6a

6b

Aldehyde. A solution of alcohol (-)-5 (200 mg, 1.88 mmol, $86 \%$ ee $)^{4}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added to a mixture of pyridinium chlorochromate $(2.83 \mathrm{~g}, 13$ $\mathrm{mmol})$ and Celite $(2.83 \mathrm{~g})$ in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(11$ mL ) at room temperature. After stirring 3.5 h , the mixture was filtered through a bed of Florisil (elution with $2: 3 \mathrm{Et}_{2} \mathrm{O}$ /pentane). Fractions containing the aldehyde were combined and carefully concentrated under reduced pressure maintaining a bath temperature of $0{ }^{\circ} \mathrm{C}$ to give aldehyde $(\sim 100 \mathrm{mg} \text {, volatile! })^{5}$ as a clear, colorless oil which was used in the next step without further purification.

Reformatsky Reaction. ${ }^{6} \mathrm{Zn}$ dust ( $1.26 \mathrm{~g}, 19.3 \mathrm{mmol}$ ) was suspended in anhydrous THF ( 8 mL ) and the mixture heated to $40^{\circ} \mathrm{C} . \mathrm{TMSCl}(260 \mathrm{mg}, 2.4 \mathrm{mmol})$ was added and the temperature elevated to $55^{\circ} \mathrm{C}$. After 15 minutes, the pressure of the reaction flask was reduced to $250-260 \mathrm{~mm} \mathrm{Hg}$ to produce a steady reflux. Methyl bromoacetate $(2.70 \mathrm{~g}, 17.7 \mathrm{mmol})$ was added dropwise over approximately 10 minutes at which time the mixture turned a yellow-green color. The mixture was stirred an additional 5 minutes then cooled to room temperature. After excess solids had settled, the supernatant was transferred under nitrogen through a nylon syringe filter $(0.45 \mu \mathrm{~m})$ into a clean, dry scintillation vial.
The resulting bromozincate reagent ( $\sim 0.57 \mathrm{mmol}$ ) was added dropwise to a mixture of aldehyde ( 50 $\mathrm{mg}, 0.48 \mathrm{mmol})$ in THF ( 2 mL ) at $0{ }^{\circ} \mathrm{C}$ and the pale yellow mixture stirred 20 minutes then allowed to warm to room temperature over 2 hours. The mixture was quenched with a mixture of concentrated $\mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})(2.3 \mathrm{~mL})$ and saturated $\mathrm{NH}_{4} \mathrm{Cl}_{(\text {(aq })}(23 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 10 \mathrm{~mL})$. The combined $\mathrm{Et}_{2} \mathrm{O}$ extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure. Flash chromatography (silica, 2:3 $\mathrm{Et}_{2} \mathrm{O}$-pentane) gave an inseparable mixture of $\mathbf{6 a}$ and $\mathbf{6 b}$ ( $56 \mathrm{mg}, 66 \%, d r \sim 1: 1$ ) as a clear, colorless oil which was used immediately in the next step.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 3.78$ (ddd, $1 \mathrm{H}, 9.0,6.2,3.2 \mathrm{~Hz}$ ), 3.71 (s, 3 H ), 3.62 (ddd, $1 \mathrm{H}, 7.8,6.6$, 3.9 Hz ), 3.04 (ddd, $1 \mathrm{H}, 7.2,4.0,3.9 \mathrm{~Hz}$ ), 2.97 (ddd, $1 \mathrm{H}, 7.6,3.6,3.6 \mathrm{~Hz}$ ), 2.67-2.52 (m, 2H, overlap), 1.37-1.29 (m, 1H, overlap), $1.08(\mathrm{q}, 1 \mathrm{H}, 6.7 \mathrm{~Hz}), 1.01-0.94\left(\mathrm{~m}, 2 \mathrm{H} \boldsymbol{6} \boldsymbol{a}^{*}\right.$ and $\left.1 \mathrm{H} \boldsymbol{6} \boldsymbol{b}^{*}\right) ;$ LR-ESI-MS m$/ z$ $211.20[\mathrm{M}+\mathrm{Na}]^{+} *$ arbitrary assignment.

## 2-Napthone Ester Standards: 7a, 7b, 7c and 7d

A mixture of diastereomers $\mathbf{6 a}$ and $\mathbf{6 b}(1: 1$, ee $86 \%)(5.8 \mathrm{mg}, 0.035 \mathrm{mmol})$ was dissolved in $250 \mu \mathrm{~L}$ of $\mathrm{LiOH}(1.45 \mathrm{mg}, 0.053)$ and then stirred for 3 min , then added with $250 \mu \mathrm{~L}$ solution of $\alpha$-bromo-2acetonaphthalene ( $88 \mathrm{mg}, 0.355 \mathrm{mmol}$ ) in THF and stirred vigorously at RT for 24 h . The reaction mixture was neutralized with $250 \mu \mathrm{~L} \mathrm{HCl}(1.90 \mathrm{mg}, 0.053)$ to pH 6.0 the extracted with 1 mL CHCl 3 $(3 x)$. The organic layer was dried under reduced pressure to form a yellow solid residue which then purified by flash chromatography 8:2 EtOAc:hexane to yield the mixture of diastereomers ( $5.4 \mathrm{mg}, 23$ $\%$ yield) as colorless oil. Individual diastreomers were separated by HPLC (3:7 $i$ - PrOH -hexane, chiral column, Chiralpak ${ }^{\circledR} \mathrm{AD}, 250 \times 4.6 \mathrm{~mm}$ ) to afford pure samples of $7 \mathbf{7 a}\left(t_{\mathrm{R}} \min =11.68\right), 7 \mathrm{c}\left(t_{\mathrm{R}}=13.05\right)$, $7 \mathbf{d}\left(t_{\mathrm{R}}=13.74\right)$ and $\mathbf{7 b}\left(t_{\mathrm{R}}=14.83\right)$ in the ratios 10:0.9:0.6:7.5 respectively.

Preparation of $(R)$ - and (S)-MTPA esters of $(R)$-2-(naphthalen-2-yl)-2-oxoethyl 3-((1S,2R)-2-chlorocyclopropyl)-3-hydroxypropanoate. Separate solutions of $7 \mathbf{7 a}(100 \mu \mathrm{~g})$ in dry pyridine (100 $\mu \mathrm{L})$ were treated with added $(R)$ - or $(S)$-MTPACl $(5 \mu \mathrm{~L})$ and the mixture stirred vigorously at r.t. for 2 $h$. The reaction mixtures were concentrated by under reduced pressure and each residue purified by silica gel chromatography (pencil column) with elution by 9:1 EtOAc:hexanes to afford pure ( $S$ )-8 (white solid; $100 \mu \mathrm{~g}, 85 \%$ ) or ( $R$ )-9 (white solid; $100 \mu \mathrm{~g} ; 86 \%$ ).

## Hydrolysis-Derivatization of 1 with $\alpha$-Bromo-2-Acetonaphthalene

Muironolide A ( $1,30 \mu \mathrm{~g}, 0.050 \mathrm{mmole}$ ) was dissolved in THF ( $50 \mu \mathrm{~L}$ ) and treated with aqueous LiOH solution $(0.002 \mathrm{M}, 50 \mu \mathrm{~L})$, and the mixture stirred at r.t. for 1.5 h before neutralization with aqueous $\mathrm{HCl}(0.002 \mathrm{M}, 50 \mu \mathrm{~L})$. The mixture was dried under the stream of $\mathrm{N}_{2}$ and the residue re-dissolved in a mixture of $\mathrm{H}_{2} \mathrm{O}(25 \mu \mathrm{~L}$, HPLC grade) and aqueous $\mathrm{LiOH}(0.001 \mathrm{M}, 50 \mu \mathrm{~L})$, stirred for 5 min , then treated with solution of $\alpha$-bromo-2-acetonaphthalene ( $3 \mathrm{M}, 50 \mu \mathrm{~L}, 0.151 \mathrm{mmol}$ ) in THF and stirred vigorously at rt for 24 h . The reaction mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(500 \mu \mathrm{~L})$ and extracted with $\mathrm{CHCl}_{3}(3 \times 500 \mu \mathrm{~L})$. The combined organic layers were concentrated under reduced pressure and the residue purified by flash chromatography (silica, pencil column, 30 mm ) eluting with $1: 4 \mathrm{EtOAc}-$ hexane. Fractions corresponding to the product were pooled and dried under reduced pressure and dissolved in $20 \mu \mathrm{~L}$ of $\mathrm{CH}_{3} \mathrm{CN}$ (HPLC grade) for LCMS analysis.

## LC-ESI-MS Analysis

The acetonapthone derivative of $\mathbf{1}$ was analysed by LC-MS using a ThermoElectron Accela series ultra-high pressure liquid chromatograph (UPLC) and a ChiralPak AD-RH column ( $2.1 \times 150 \mathrm{~mm}, 5 \mu$ ) connected to a PDA and ThermoFinnigan MSQ quadrupole mass spectrometer. LC parameters were as follows; isocratic $1: 4 \mathrm{HCOOH}(0.1 \% \mathrm{aq})-\mathrm{CH}_{3} \mathrm{CN}, 80 \%(0.2 \mathrm{~mL} / \mathrm{min}$, over 20 min . Injection volume was $3 \mu \mathrm{~L}$. PDA parameters were as follows; channel A; 210 nm ; channel B, 248 nm ; channel C, 284 nm . MSQ parameters were as follows; ESI-MS, selected ion monitoring at $m / z 355.07[\mathrm{M}+\mathrm{Na}]^{+}$, span 1.5 amu ; dwell, 0.6 sec ; cone voltage, 75 V ; probe temperature $450^{\circ} \mathrm{C}$. Retention times ( min ) for the naphthone ester derivatives were as follows: 7a, $t_{\mathrm{R}}=13.84 ; 7 \mathbf{c}, t_{\mathrm{R}}=9.05 ; \mathbf{7 d}, t_{\mathrm{R}}=9.90 ; 7 \mathbf{b}, t_{\mathrm{R}}=11.13$. The naphthone ester, derived from hydrolysis-derivation of $\mathbf{1}$, eluted at $t_{\mathrm{R}}=11.13 \mathrm{~min}$. and was confirmed by co-injections with standard naphthone ester 7b that co-eluted as a single peak ( $t_{\mathrm{R}}=11.11$ min). See Figure S20.
