## General information.

All reactions were carried out in flame dried Schlenk tubes under argon atmosphere employing standard manifold techniques. Solvents were dried by standard methods. NMR spectra were recorded on JEOL 270 MHz , JEOL 400 MHz or Eclipse 300 MHz spectrometers using tetramethylsilane as the internal standard ( 0.00 ppm ). nOe's spectra were recorded on a VARIAN 500 MHz spectrometer. $\mathrm{CDCl}_{3}$ was used as an internal standard for ${ }^{13} \mathrm{C}$ NMR spectra ( 77.0 ppm ). CI mass spectra were obtained using a VG Platform mass spectrometer. All IR data were obtained on a Perkin-Elmer Spectrum One FT-IR spectrometer. All MS were recorded on Agilent Technologies GC-MS Spectrum equipped with 6890 Series GC system, 7683 Series injector and 5973 Network Mass Selective detector. Analytical TLC was done on aluminium backed plates ( $1.5 \times 5 \mathrm{~cm}$ ) pre-coated ( 0.25 mm ) with silica gel (Merck, Silica Gel $60 \mathrm{~F}_{254}$ ). Compounds were visualised by exposure to UV light or by dipping the plates in a solution of $5 \%\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Mo}_{7} \mathrm{O}_{24} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ in $95 \% \mathrm{EtOH}(\mathrm{w} / \mathrm{v})$ followed by heating. Flash chromatography was done on silica gel (Merck Kieselgel 60). Melting points were determined with a Kofler hot stage apparatus and were not corrected. Optical rotations were obtained on a Perkin-Elmer 241MC polarimeter. Chiral HPLC separations were done on Agilent 1100 series normal phase high performance liquid chromatography units using HP Chemstation for LC or LC/MS. Daicel Chiralcel AD and OD-H ( $0.46 \times 25 \mathrm{~cm}$ ) were used for normal phase separations.

All chemicals were used as received from the supplier except for tertbutyloxirane (distilled over activated $4 \AA$ molecular sieves) and 2,2,6,6tetramethylpiperidine (distilled over $\mathrm{CaH}_{2}$ ). $s \mathrm{BuLi}$ was purchased as a 1.3 M solution in cyclohexane from either Fluka or Acros Chemical Compagnies. $N, N, N, N-$ Tetramethylethylenediamine (TMEDA) was purchased from Aldrich and distilled over $\mathrm{CaH}_{2}$ prior to use. Boronic pinacol ester were synthesized according to literature procedures. ${ }^{1}$

## Experimental Procedures \& Data

General procedure for the preparation of lithium 2,2,6,6-tetramethylpiperidide.
A 10 ml Schlenk tube was charged with 2,2,6,6-tetramethylpiperidine ( $1.33 \mathrm{ml}, 0.75$ M in THF). The solution was thereafter cooled to $-30^{\circ} \mathrm{C}$ followed by addition of $n B u L i(0.40 \mathrm{ml}, 2.5 \mathrm{M})$. The resulting reaction mixture was then stirred for 30 min at room temperature.

General procedure for the homologation of boronates with epoxides leading to diols.

A 10 ml Schlenk tube was charged with the corresponding epoxide $(0.50 \mathrm{mmol})$ and boronate ( $1.00 \mathrm{mmol}, 1.00 \mathrm{M}$ in THF). The resulting solution was thereafter cooled to $-30^{\circ} \mathrm{C}$ followed by dropwise addition of freshly prepared lithium 2,2,6,6tetramethylpiperidide $(1.00 \mathrm{mmol})$. The reaction mixture was then stirred 2 h at $-30^{\circ} \mathrm{C}$ at which the reaction flask was transferred to an ice bath and $\mathrm{NaOH}(1.0 \mathrm{ml}, 2.0 \mathrm{~m})$ and $\mathrm{H}_{2} \mathrm{O}_{2}(0.50 \mathrm{ml},>30 \% \mathrm{w} / \mathrm{v})$ were added. The reaction mixture was stirred an additional 2 h at $4^{\circ} \mathrm{C}$ and was then diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{ml})$ and extracted with DCM (4 $\times 7 \mathrm{ml}$ ). The combined organic layer was dried over magnesium sulphate. The organic solvents were then removed and the crude product was subjected to silica gel flash chromatography.

The stereochemistry of $9 \mathbf{c}$ was determined by conversion to 1-cyclohexyl-1-phenylethane-1,2-diol ( $\mathbf{9} \mathbf{c}^{\mathbf{\prime}}$ ): 59 mg of $\mathbf{9 c}$ were dissolved in 1 mL of THF and tetrabutylammonium fluoride ( $83 \mathrm{mg}, 0.26 \mathrm{mmol}$ ) was added. The resulting mixture was stirred at room temperature for 1 h . The organic solvents were then removed and the crude product was purified by flash chromatography $\left(\mathrm{SiO}_{2}, 50 \% \mathrm{Et}_{2} \mathrm{O} / \mathrm{Petrol}\right)$ to yield to 1-cyclohexyl-1-phenylethane-1,2-diol 9c’ as a colorless oil (38 mg, 97\%). ${ }^{1}$ H NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.36-7.46(\mathrm{~m}, 4 \mathrm{H}), 7.27-7.32(\mathrm{~m}, 1 \mathrm{H}), 4.05(\mathrm{dd}, J=11.2,4.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.88(\mathrm{dd}, J=11.2,9.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.63(\mathrm{~s}, 1 \mathrm{H}), 0.99-1.90(\mathrm{~m}, 11 \mathrm{H}) ;{ }^{13} \mathrm{C}(100 \mathrm{MHz}$,
