Materials and Methods:

¹H NMR and ¹³C NMR spectra were recorded in deuterated solvents on a Bruker DMX 300 NMR Spectrometer and a Bruker ADVANCE 600 NMR Spectrometer. ¹H NMR chemical shifts are reported in ppm downfield from tetramethylsilane (TMS) reference using the residual protonated solvent as an internal standard. Mass spectra (MALDI-TOF-MS) were determined on a Bruker BIFLEX Mass Spectrometer.

N,N'-di(2,6-diisopropylphenyl)-1,6,7,12-tetrabromoperylene-3,4:9,10-tetracarboxylicbisimides were prepared according to a known procedure.¹ All chemicals were purchased from commercial suppliers and used without further purification unless otherwise specified. DMSO was freshly distilled from CaH₂. Two isomers of tri(perylene bisimides) were separated by HPLC using Cosmosil Buckyprep as the column and toluene as the eluent.

Absorption spectra were measured with Hitachi (model U-3010) UV-Vis spectrophotometer in a 1-cm quartz cell. Cyclic voltammograms (CVs) were recorded on a CHI66 electrochemical workstation using glassy carbon discs as the working electrode, Pt wire as the counter electrode, Ag/AgCl electrode as the reference electrode, and ferrocene/ferrocenium as an internal potential marker. 0.1 M tetrabutylammonium hexafluorophosphate (TBAPF₆) dissolved in CH₂Cl₂ was employed as the supporting electrolyte. CH₂Cl₂ was freshly distilled prior to use. The reduction potentials have been recalculated to the reference of Fc/Fc⁺. The energy level of Fc/Fc⁺ is assumed to be -4.8 eV below the vacuum level.² The oxidation potential of Fc/Fc⁺ was measured as 0.40 V against Ag/AgCl.

Synthesis and Characterization of triPBIs:

triPBIs 5 and 6.

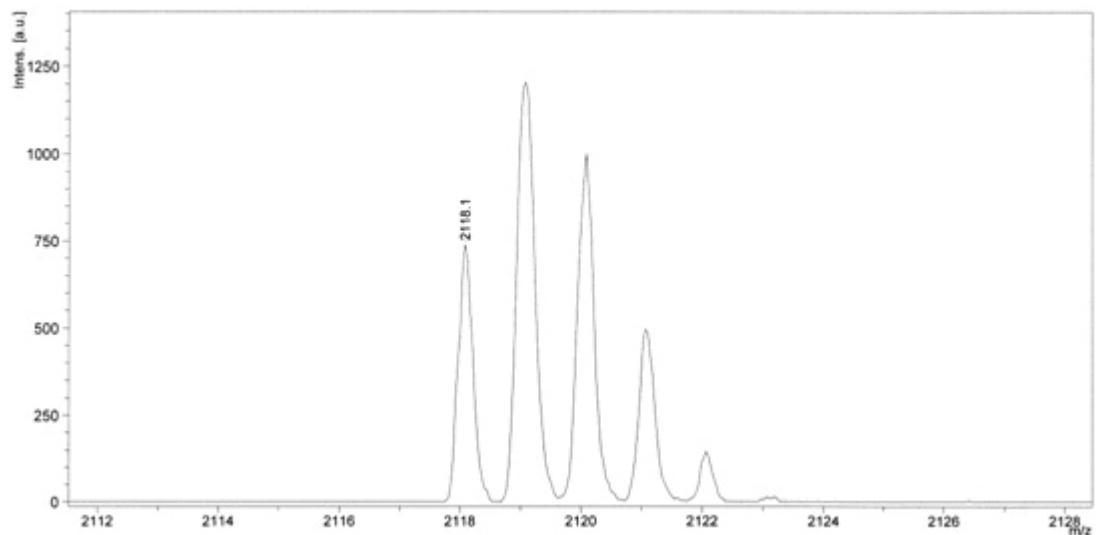

A mixture of tetrabromoperylene bisimide (634 mg, 0.62 mmol), CuI (706 mg, 3.72 mmol), L-proline (500 mg, 4.35 mmol), K₂CO₃ (856 mg, 6.2 mmol) in 10 ml DMSO was heated at 110 °C under Ar for 12 h. The cooled mixture was poured into 1M HCl, and stirred for 1 hr. After filtration, the obtained solids were washed with brine, dried under vacuum, dissolved in CH₂Cl₂, and purified by column chromatography (silica gel, CH₂Cl₂). Yield 65 mg (15%) **diPBI** as black

solids and 70 mg (16%) **triPBIs** as dark-green solids. The obtained **triPBIs** were separated by HPLC into two fractions using Cosmosil Buckyprep as the column and toluene as the eluent. After separation, triPBI **5** (18 mg) and **6** (52 mg) were obtained, in total yield of 4% and 12%, respectively. MS (MALDI-TOF): calcd for **triPBI** C₁₄₄H₁₁₄N₆O₁₂, 2118.8 [M]⁻; found, triPBI **5** *m/z* = 2118.1; triPBI **6** *m/z* = 2118.2.

triPBI 5. ¹H NMR (CDCl₃, 300 MHz, 298 K): δ = 10.81 (s, 2H), 10.24 (s, 2H), 9.56 (m, 4H), 9.45 (d, 2H), 9.21 (d, 2H), 7.40-7.60 (m, 18H), 2.62-3.06 (b, 12H), 0.98 (m, 24H), 0.86 (m, 48H). ¹³C NMR of **5** can not be well resolved.

triPBI 6. ¹H NMR (1,2-dichlorobenzene-d4, 300 MHz, 383 K): δ = 10.57 (s, 2H), 10.44 (s, 2H), 9.30 (d, 2H), 9.13 (d, 2H), 8.97 (m, 4H), 7.30 (m, 6H), 7.26 (m, 12H), 3.12 (b, 6H), 2.77 (m, 6H), 1.11 (m, 24H), 1.06 (m, 12H), 1.03 (m, 12H), 0.94 (m, 12H), 0.74 (m, 12H). ¹³C NMR (CDCl₃, 100 MHz, 298K): δ = 164.0, 163.8, 163.6, 163.1, 163.0, 134.9, 134.7, 133.8, 132.6, 131.7, 130.9, 130.7, 130.6, 129.8, 129.7, 129.5, 129.4, 129.2, 128.9, 128.3, 127.7, 127.6, 126.0, 125.0, 124.8, 124.6, 124.3, 124.2, 124.1, 123.4, 122.9, 122.6, 121.9, 120.5, 118.9, 30.5, 30.2, 29.7, 29.2, 29.1, 28.8, 25.3, 25.1, 24.7, 24.3, 24.2, 24.1, 23.8, 22.7, 19.2.
