## 1. Experimental procedure

## General

All reagents and solvents were of commercial reagent grade and were used without further purification. ${ }^{1} \mathrm{H},{ }^{11} \mathrm{~B}$, and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a JEOL delta-600 spectrometer, and chemical shifts were reported as the delta scale in ppm relative to internal standards $\left(\mathrm{CHCl}_{3}\left(\delta=7.26 \mathrm{ppm}\right.\right.$ for ${ }^{1} \mathrm{H}, 77.16 \mathrm{ppm}$ for $\left.{ }^{13} \mathrm{C}\right)$, and an external standard, $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ in $\mathrm{CDCl}_{3}\left(\delta=0.00 \mathrm{ppm}\right.$ for $\left.{ }^{11} \mathrm{~B}\right)$ ). Spectroscopic grade solvents were used for all spectroscopic studies without further purification. UV/visible absorption spectra were recorded on a Shimadzu UV-3100 spectrometer. Fluorescence spectra were recorded on a Hamamatsu Photonics C9920-02 spectrometer, and absolute fluorescence quantum yields were measured by photon-counting method using an integration sphere. ESI-TOF-MS spectra were recorded on a BRUKER DALTONICS microTOF LC using positive-ion mode. Thin layer chromatography (TLC) was performed on a silica gel sheet, MERCK silica gel $60 \mathrm{~F}_{254}$. Preparative separations were performed by silica gel gravity column chromatography (Wako gel C-300) or size exclusion gel permeation chromatography (GPC) (Bio-Rad Bio-Beads S-X1, packed with THF).

Pyridine-tri- $N$-pyrrolylborane was prepared by the reported procedure. ${ }^{51}$ Dry $\mathrm{N}, \mathrm{N}$-dimethylformamide was distilled from $\mathrm{CaH}_{2}$.

## 4,4'-Biphenylene bridged dimer 1

To a suspension of pyridine-tri-N-pyrrolylborane ( $1.50 \mathrm{~g}, 5.21 \mathrm{mmol})$ in 1,2-dichlorobenzene 225 ml , were added benzaldehyde ( $1.12 \mathrm{ml}, 11.00 \mathrm{mmol}$ ) and 4-bromobenzaldehyde ( $0.83 \mathrm{~g}, 4.50 \mathrm{mmol}$ ), and the mixture was cooled to $0{ }^{\circ} \mathrm{C}$ with an ice / water bath. After dropwise addition of trifluoroacetic acid ( $0.50 \mathrm{ml}, 6.73 \mathrm{mmol}$ ) via syringe, the solution was stirred for 1 h at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. The acid was quenched with 0.60 ml of pyridine, and the resulting solution was refluxed for 1 h under aerobic conditions. After the solution was cooled to room temperature, the solvent was removed in vacuo. To the residual black tar, a mixture of THF/ MeOH (1:1) 50 ml was added and heated at $50^{\circ} \mathrm{C}$ for 10 min . After the removal of insoluble materials by filtration, the solvent was once evaporated, and the residue was mounted onto a GPC column ( $6 \times 40 \mathrm{~cm}$, packed with THF) with a minimal amount of THF. Polymeric byproducts that eluted first was removed and the yellowish fractions that eluted around $\mathrm{R}_{\mathrm{f}}=0.50$ on TLC (silica gel; eluent: $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane/ether=1:2:1) were collected. After passing through a short silica gel column (eluent: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ / hexane/ether=1:1:1), the crude mixture was dissolved in 30 ml of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and treated with 10 g of $\mathrm{MnO}_{2}$ at room temperature overnight with vigorous stirring. The oxidant was removed by passing the suspension through a short Celite ${ }^{\circledR}$ pad. Further purification by silica gel column chromatography (eluent: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ / hexane/ether=1:2:1) gave a crude mixture of subporphyrins as orange-brown solid.

A 50 ml Schlenk tube was charged with the subporphyrin mixture, dry DMF ( 5 ml ) $\mathrm{NiCl}_{2}$ (diphenylphosphinopropane) ( $25 \mathrm{mg}, 46 \mu \mathrm{~mol}$ ), zinc powder ( 100 mg ), and potassium iodide ( 100 mg ). The resulting solution was deoxygenated via three freeze-pump-thaw cycles, and then stirred at $80^{\circ} \mathrm{C}$ for 12 h under $\mathrm{N}_{2}$ atmosphere. The resulting mixture was filtered, the filtrate was poured into 50 ml of water, and the products were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{ml} \times 3)$. Combined organic layer was washed with brine and water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and the solvent was evaporated. The products were separated by GPC column $(4 \times 90 \mathrm{~cm})$ to give dimer 1 as the second-to-last fraction and triphenylsubporphyrin 3 as the last fraction. Recrystallization from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ afforded $\mathbf{1}(30 \mathrm{mg}, 1.3 \%)$ and $3(62 \mathrm{mg}, 2.4 \%)$ as orange crystalline solids.

## Cyclic dimer 5

Dimer $2(4.8 \mathrm{mg}, 5.0 \mu \mathrm{~mol})$ and biphenyl-3,3'-dicarboxylic acid (4) ( $1.2 \mathrm{mg}, 5.0 \mu \mathrm{~mol}$ ) were dissolved in toluene 40 ml and refluxed with a Dean-Stark trap for 6 h . Evaporation of the solvent gave orange crystalline solid of 5 quantitatively.

This material was stable in the solid state, however, it was partially hydrolyzed by adventitious water to release axial ligand after overnight storing in solution.
