General Method

All reactions involving air- and moisture-sensitive reagents were carried out under N₂. CH₂Cl₂, toluene, dimethyl sulfoxide (DMSO) and N,N-dimethylformamide (DMF) were distilled over CaH₂ before use. Tetrahydrofuran (THF) and diethyl ether (Et₂O) were distilled after refluxing over Na-benzophenone before use. Silica gel F₂₅₄ TLC aluminum sheets were used for routine monitoring of reactions. Column chromatography was performed on silica gel (70-230 mesh, ASTM).

¹H and ¹³C NMR spectra were recorded at 500 and 125 MHz respectively. Internal references for ¹H NMR spectra were 0.0 ppm (Me₄Si) for CDCl₃, 3.30 ppm for CD₃OD, and 7.16 ppm for C₆D₆. Chemical shifts for ¹³C NMR spectra were referenced to CDCl₃ (77.0 ppm), CD₃OD (49.0 ppm), and C₆D₆ (128.0 ppm). MS were recorded under electron ionization (EI; 70eV).

X-ray Crystal Structure Determination. A crystal suitable for X-ray structure determination was mounted on a imaging plate equipped with graphitemonochromated Mo-K α radiation ($\lambda=0.71073$ Å). Unit-cell parameters were determined by autoindexing several images in each data set separately with the DENZO program.¹ For each data set, rotation images were collected in 3° increments with a total rotation of 180° about ϕ (60 frames). Data were processed by using the SCALEPACK program.¹ The structure were solved by a direct method and refined by full-matrix least-squares methods with the TeXsan (Rigaku) program.² Crystallographic data for the structure reported in this paper have been deposited with the Cambridge Crystallographic Data Center; **8**: CCDC-693403; **12**: CCDC-693404.
