## EXPERIMENTAL SECTION

Reagents were used as purchased (Aldrich, Acros, Alfa Aesar, TCI), except where noted. Chromatographic separations were performed using Bodman $60 \AA \mathrm{SiO}_{2} .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained on Varian VI-400 and VI-500 spectrometers using $\mathrm{CDCl}_{3}$ (except where noted) with TMS or residual solvent as standard. Melting points were determined using a Laboratory Devices MEL-TEMP and are uncorrected/calibrated. Infrared spectra were obtained using a Bruker Equinox 55 FTIR Spectrometer. TLC analysis was performed using 254 nm polyester-backed plates ( $60 \AA, 250 \mu \mathrm{~m}$ ) and visualized using UV, KMnO 4 stains. Low-resolution mass spectra were obtained using an Agilent 1100 series LS/MSD and are APCI. High-resolution mass spectral analyses performed at University of Wisconsin School of Pharmacy Mass Spectrometry Laboratory. X-Ray analysis performed at University of Minnesota Department of Chemistry X-Ray facility. All spectral data obtained for new compounds are reported here.

## Synthesis of the Alcohol 6.

To a flame dried flask under $\mathrm{N}_{2}$ was added $\mathbf{5}(0.30 \mathrm{~g}, 0.59 \mathrm{mmol})$ and anhyd $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$. The solution was cooled to $-15^{\circ} \mathrm{C}$, then triethylsilane ( $3.00 \mathrm{~mL}, 18.6 \mathrm{mmol}$ ) and trifluoroacetic acid $(0.55 \mathrm{~mL}$, 7.11 mmol ) were added dropwise. The resulting solution was sealed and kept in the freezer for 48 h at -20 to $-10{ }^{\circ} \mathrm{C}$, and then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ and worked-up with sat aq $\mathrm{NaHCO}_{3}$ until basic. The organic layer was separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$. The combined organic layers were washed with sat aq $\mathrm{NaCl}(30 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under reduced pressure. Purification of the crude residue via silica gel flash column chromatography (isocratic eluent: EtOAc) gave $6(0.23 \mathrm{~g}, 80 \%)$ as a white solid.

## Synthesis of Alkene 23.

To a solution of $\mathbf{2 0}(34.3 \mathrm{mg}, 0.059 \mathrm{mmol})$ in anhyd THF ( 1.5 mL ) was added DIBAL-H ( 1.0 M in hexanes, $0.237 \mathrm{~mL}, 0.237 \mathrm{mmol}$ ) dropwise at $-40^{\circ} \mathrm{C}$. When the reaction was completed (about 2 h via TLC analysis or LCMS), methanol was added at the same temperature followed by sat aq potassium sodium tartrate solution and the reaction was stirred vigorously. When two phases of the solution were clear after a few hours, the organic layer was separated, and the aqueous layer was extracted with $\mathrm{EtOAc}(2 \times 15$ $\mathrm{mL})$. The combined organic layers were washed with sat aq $\mathrm{NaCl}(30 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under reduced pressure. Purification of the crude residue via silica gel flash column chromatography afforded (gradient eluent: 20-50\% of EtOAc/hexanes) an alcohol intermediate ( 30.1 mg ,
$92 \%)$ as a colorless oil: $R_{f}=0.45[50 \% \mathrm{EtOAc} / \mathrm{Hexanes}] ;{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 0.45-0.64$ (brm, $1 \mathrm{H}), 0.64-0.92(\mathrm{brm}, 1 \mathrm{H}), 1.04-1.15(\mathrm{~m}, 10 \mathrm{H}), 1.15-1.32(\mathrm{~m}, 7 \mathrm{H}), 1.30-1.52(\mathrm{~m}, 13 \mathrm{H}), 1.63-1.77(\mathrm{~m}, 1 \mathrm{H})$, 2.17-2.27 (m, 1H), 3.30-3.70 (brm, 3.5H), 3.70-3.85 (m, 0.5H), 4.04-4.22 (brm, 1H), 7.35-7.47 (m, 6H), $7.68\left(\mathrm{t}, 4 \mathrm{H}, J=8.0 \mathrm{~Hz}\right.$ ); mass spectrum (APCI): m/e (\% relative intensity) 452.3 (100) M+H-Boc) ${ }^{+}$, 418.2 (65), 374.3 (30). This alcohol was oxidized by DMP directly.

To a solution of the above alcohol ( $30.1 \mathrm{mg}, 0.055 \mathrm{mmol}$ ) and $\mathrm{NaHCO}_{3}(37.0 \mathrm{mg}, 0.44 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 3 mL ) was added self-made Dess-Martin periodinane ( $35.0 \mathrm{mg}, 0.0825 \mathrm{mmol}$ ). The reaction solution was then stirred at rt for about 30 min . When the reaction was completed as indicated by TLC analysis ( $30 \% \mathrm{EtOAc} / \mathrm{Hexanes}$ ) or LCMS, the reaction was quenched with a few drops of isopropyl alcohol. The reaction was filtered through Celite ${ }^{\mathrm{TM}}$ and concentrated under reduced pressure. Purification of the crude residue via a short silica gel column (isocratic eluent: 30\% EtOAc) afforded 21 ( $28.8 \mathrm{mg}, 96 \%$ ) as colorless oil.

Aldehyde 21 was immediately used for the following step.

To a solution of sulfone $22(43.4 \mathrm{mg}, 0.123 \mathrm{mmol})$ in THF $(2 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was dropwise added NaHMDS ( 1.0 M in THF, $0.123 \mathrm{~mL}, 0.123 \mathrm{mmol}$ ). After the reaction mixture was stirred for 30 min , a solution of $21(28.8 \mathrm{mg}, 0.0525 \mathrm{mmol})$ in THF ( 1.5 mL ) was dropwise added, and additional THF ( 0.5 mL ) was used to rinse the vial containing 21, which was also added to the reaction solution. After the reaction was stirred for 1 h at $-78^{\circ} \mathrm{C}$, the reaction mixture was allowed to warm to rt overnight. Then sat aq NaCl was added to quench the reaction, and the solution was diluted by EtOAc ( 6 mL ) and $\mathrm{H}_{2} \mathrm{O}(6 \mathrm{~mL})$. The organic layer was separated, and the aqueous layer was extracted with EtOAc ( $2 \times 15 \mathrm{~mL}$ ). The combined organic layers were washed with sat aq NaCl , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under reduced pressure. Purification of the crude residue via silica gel flash column chromatography (gradient eluent: 10-30\% of EtOAc/hexanes) afforded 23 ( $32.0 \mathrm{mg}, 90 \%$ ) as a colorless oil.
