

**Supplemental Table 1: Data collection and refinement statistics of Ma-Flr-1.**

<sup>a</sup> <b>Data collection</b>		<b>Refinement</b>	
Wavelength (Å)	1.5414	Resolution (Å)	20-2.05
Resolution (Å)	30-2.05	R <sub>work</sub> /R <sub>free</sub> (%)	20.84/26.50
No. of Reflections (tot./uni.)	339,679/22,357	B-factors:	
Completeness (%)	98.3 (84.9)*	Protein	20.796
I/σ(I)	31.3 (3.7)*	Ligand	15.776
R <sub>sym</sub> <sup>b</sup> (%)	9.5 (44.0)*	Water	21.865
Wilson B factor (Å <sup>2</sup> )	35.2	R.m.s deviations:	
		Bond lengths (Å)	0.011
		Bond angles (°)	1.361

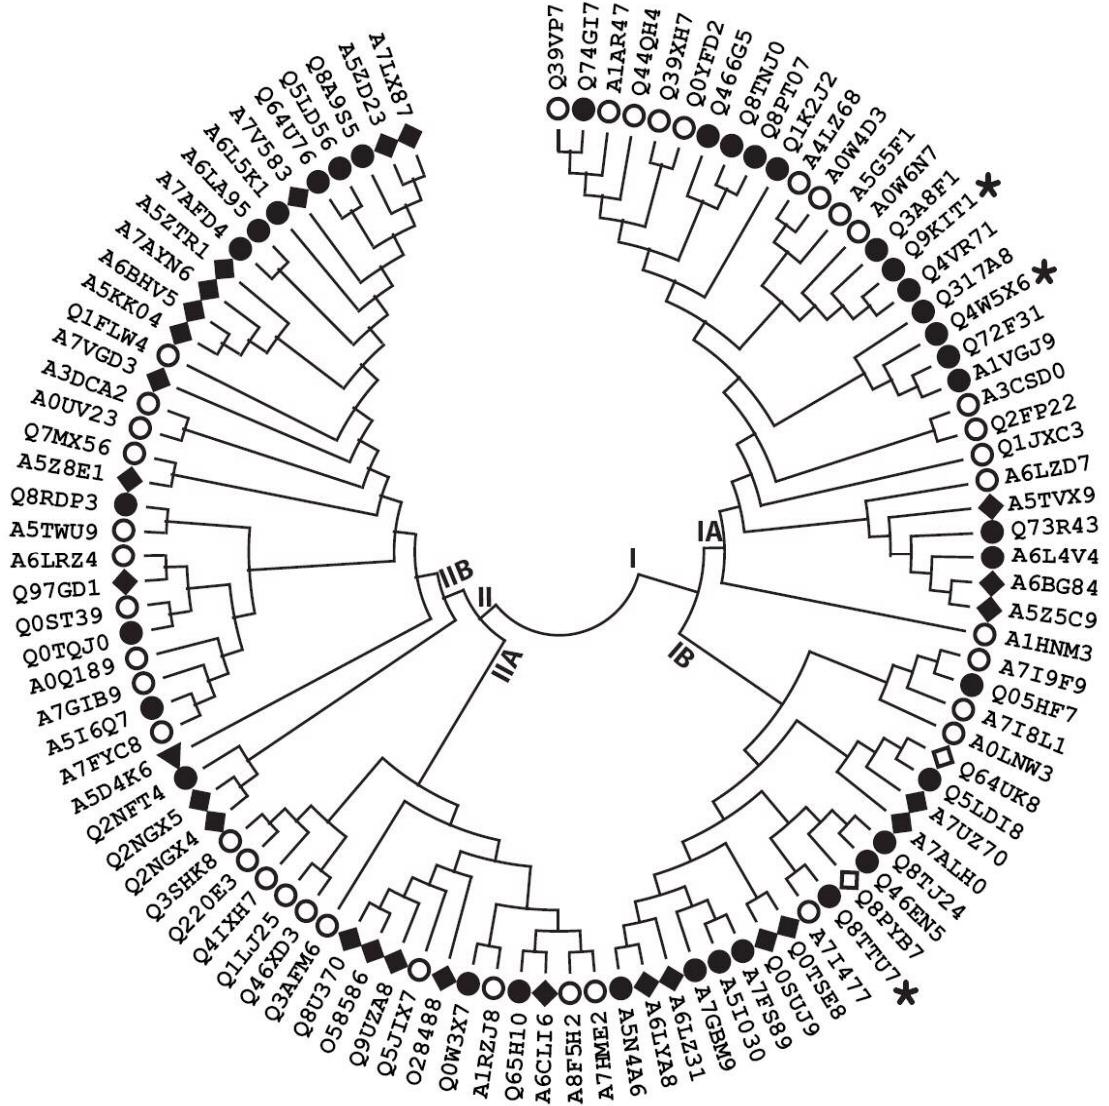

<sup>a</sup>Data set was collected on a Rigaku RU-200 rotating anode generator equipped with Osmic confocal “blue” optics, and diffraction intensities were recorded on an R-axis IV image plate system; <sup>b</sup>R<sub>sym</sub> =  $\sum|I - \langle I \rangle| / \sum I$ , where  $I$  is observed intensity and  $\langle I \rangle$  is average intensity obtained from multiple observations of symmetry related reflections; \*highest resolution shell (2.12-2.05 Å) is shown in parenthesis.

**Supplemental Figure S1. Sequence alignments of representative flavoredoxin homologs shown in Fig. S2.** The grey-shadowed residues are proposed to contribute in FMN binding and the black-shadowed glycine for accommodating space necessary for FMN binding. The numbers in parentheses indicate percent identity to Ma-Flr-1 (Q8TTU7) and the clades shown in Figure S2.
