Supporting Information for "Limits of Recognition for Binary and Ternary Vapor Mixtures Determined with Multi-Transducer Arrays" by C. Jin and E. T. Zellers

The results tabulated below are from analyses performed with the 5 -sensor MT array and 5 -sensor CAP ST-array related to the LOR determinations of 12 binary mixtures. The analyses are similar to those performed for the 8 -sensor MT-U array in the main body of the article.

Table SI-1. LOR evaluations of 12 binary mixtures using simulated data from the 5 -sensor MT-U array.

| Components <br> A |  | $\mathrm{BR}(\%)^{\mathrm{a}}$ | $\mathrm{LOR}_{95}$ | $\mathrm{LOD}_{\mathrm{A}}{ }^{\mathrm{b}}$ | $\mathrm{LOD}_{\mathrm{B}}{ }^{\mathrm{b}}$ | $\mathrm{S}_{\mathrm{A}}{ }^{\mathrm{c}}$ | $\mathrm{S}_{\mathrm{B}}{ }^{\mathrm{c}}$ | $\mathrm{E}_{\mathrm{AB}}{ }^{\mathrm{d}}$ | $\mathrm{e}_{\mathrm{A}} / \mathrm{e}_{\mathrm{B}}{ }^{\mathrm{e}}$ | $\mathrm{A}^{\mathrm{f}}$ | $\mathrm{P}_{\mathrm{A}}{ }^{\mathrm{g}}$ | $\mathrm{P}_{\mathrm{B}}{ }^{\mathrm{g}}$ | $\mathrm{P}_{\mathrm{A}} / \mathrm{P}_{\mathrm{B}}{ }^{\mathrm{h}}$ |

${ }^{2}$ the column of entries for $\mathrm{RCR}_{10}$ is the fold-range of relative concentration ratios for each mixture for which $\mathrm{RR} \geq 95 \%$. Each line spans that RCR range and shows the degree of asymmetry relative to the $R C R=1: 1$ value when concentrations are expressed as multiples of the LOD for each component. Values in parentheses at the end of a line are the corresponding RCR values in units of ppm.

[^0]:    ${ }^{\text {a }}$ average recognition rate determined at an $\mathrm{RCR}=1: 1$ over a concentration range of 5-10LOD for each component;
    ${ }^{\mathrm{b}}$ units $=\mathrm{ppm} ;{ }^{\mathrm{c}}$ array sensitivity in units of response/ppm; ${ }^{\mathrm{d}} E_{A B}$ is the Euclidean distance between normalized vectors for vapors A and $B ;{ }^{e} e_{A}$ and $e_{B}$ are the Euclidean distances between the vectors for components $A$ and $B$ and the vector for their $1: 1$ mixture, respectively; ${ }^{f} A$ is an index of asymmetry defined as the ratio of $\operatorname{lor}_{95-\mathrm{A}} / \mathrm{lor}_{95-\mathrm{B}}$ (see Figure 1 a in text); ${ }^{\mathrm{g}} P$ is the product of the LOD and S for a given mixture component. ${ }^{\mathrm{h}}$ Linear regression of $A$ vs. $\left(P_{A} / P_{B}\right)^{-1}$ yields an $\mathrm{r}^{2}=0.835$.

[^1]:    ${ }^{\text {a }}$ the column of entries for $\mathrm{RCR}_{10}$ is the fold-range of relative concentration ratios for each mixture for which $\mathrm{RR} \geq 95 \%$. Each line spans that RCR range and shows the degree of asymmetry relative to the $R C R=1: 1$ value when concentrations are expressed as multiples of the LOD for each component. Values in parentheses at the end of a line are the corresponding RCR values in units of ppm.
