## Supporting Information

1. General experimental methods (S2)
2. General experimental procedure and characterization data. (S2-S6)
3. References (S7)
4. Copies of  $^1\text{H}$ ,  $^{13}\text{C}$  NMR spectra of products (S8-S47)

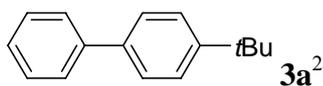

## General experimental methods:

All reactions were performed in Schlenk tubes under nitrogen atmosphere. Flash column chromatography was performed using silica gel (60-Å pore size, 32–63 μm, standard grade). Analytical thin-layer chromatography was performed using glass plates pre-coated with 0.25 mm 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm). Thin layer chromatography plates were visualized by exposure to ultraviolet light. Organic solutions were concentrated on rotary evaporators at ~20 Torr (house vacuum) at 25–35 °C. Commercial reagents and solvents were used as received. Nuclear magnetic resonance (NMR) spectra are recorded in parts per million from internal tetramethylsilane on the δ scale.

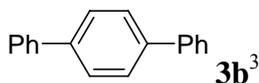

XPhos, TBAF (1.0 M in THF), triethoxy(thiophen-2-yl)silane and PhSi(OMe)<sub>3</sub> were purchased from Aldrich. PhSi(OEt)<sub>3</sub>, 4-MeOC<sub>6</sub>H<sub>4</sub>Si(OMe)<sub>3</sub>, 4-MeC<sub>6</sub>H<sub>4</sub>Si(OMe)<sub>3</sub>, 4-CF<sub>3</sub>C<sub>6</sub>H<sub>4</sub>Si(OMe)<sub>3</sub>, 2-MeC<sub>6</sub>H<sub>4</sub>Si(OMe)<sub>3</sub> were prepared according to the reported procedure.<sup>1</sup>

## General procedure for the Hiyama couplings of aryl arenesulfonates:

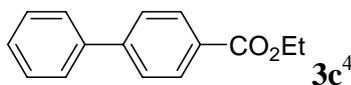

A test tube with stir bar was charged with Pd(OAc)<sub>2</sub> (2.2 mg, 4 mol %), Xphos (11.9 mg, 10 mol %) and arenesulfonate **1** (0.25 mmol). The tube was evacuated and back-filled with argon (this was repeated two additional times). siloxane **2** (2.0 equiv) and TBAF (0.5 mL, 1.0 M in THF) were added through syringe. The reaction mixture was allowed to stir at 80 °C. After cooling to room temperature, it was directly subjected to flash chromatography on silica gel to yield the desired products **3**.
