## 1. General methods

All solvents were reagent grade. PE refers to light petroleum b.p. $40-60^{\circ} \mathrm{C}$. Diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ and tetrahydrofuran (THF) were freshly distilled from sodium/benzophenone under argon. Dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ was freshly distilled from calcium hydride under argon. Reagents were purchased from commercial sources and used without further purification unless otherwise stated.
Products were purified by flash-chromatography ${ }^{[1]}$ (eluent composition given in parentheses).

Chemical shifts ( $\delta$ ) quoted in ppm; integrals in accord with assignments; coupling constants $(J)$ quoted in Hz; Melting points are uncorrected; Crystal structure determination: Diffraction data were collected on an APEX CCD area detector, using graphite monochromated $\mathrm{MoK}_{\alpha}$ radiation ( $\lambda=0.71073 \AA$ ), from a crystal cooled to 150 K using an open-flow nitrogen gas cryostat ${ }^{[3]}$. The structure was solved by direct methods using SHELXS $97{ }^{[4]}$ and refined by full-matrix least squares using SHELXL97 ${ }^{[4]}$. The figure was produced using PLATON ${ }^{[5]}$ which was also used for structure validation.

### 1.1. General procedure GP1: Preparation of dry mCPBA

Following a procedure slightly modified from that of Aggarwal and coworkers ${ }^{[6]}$, commercial 3-chloroperoxybenzoic acid (Aldrich $57-86 \%, 30 \mathrm{~g}$ ) was dissolved in $350 \mathrm{ml} \mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with $3 \times 150 \mathrm{~mL}$ buffer solution $\left(410 \mathrm{ml} 0.1 \mathrm{M} \mathrm{NaOH}, 250 \mathrm{ml} 0.2 \mathrm{M} \mathrm{KH}_{2} \mathrm{PO}_{4}\right.$ made up to $11, \mathrm{pH} 7.5$ ). The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and carefully evaporated under reduced pressure to give ca. 12 g m CPBA . Iodometric titration ${ }^{[7]}$ gave a purity of $82 \mathrm{wt} .-\%$. (In the original literature, diethyl ether was used for the extraction. To avoid the hazard of incidental formation of dialkyl peroxides, we used $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ instead. The separation of the 2

[^0]layers is slower with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ than with $\mathrm{Et}_{2} \mathrm{O}$. In $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the solubility of $m \mathrm{CPBA}$ is excellent but that of the 3 -chlorobenzoic acid is significantly lower than in $\mathrm{Et}_{2} \mathrm{O}$.)

### 1.2. General procedure GP2: $\beta$-chloroamines from their corresponding hydrochlorides

(Following the procedure of Hickmott, Wood, and Murray-Rust, ref. ${ }^{[8]}$ )
The commercially available hydrochloride ( 20.0 mmol ) was dissolved in water ( 10 mL ) and the solution was basified by adding solid $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The solution was extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times$ $15 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and the combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under reduced pressure. The residual oil was shown by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ to be the pure free amine.

### 1.2.1. $N$-(2-chloroethyl)-dimethylamine (7aa)

* CARE! $\beta$-chloroamines are known to have a high toxicity. They should be handled in a fumehood only, and with appropriate care.
(Described in literature ${ }^{[8]}$ ) Prepared according to general procedure GP2, using 2Dimethylaminoethyl chloride $\cdot \mathrm{HCl}(2.88 \mathrm{~g}, 20 \mathrm{mmol})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(4.24 \mathrm{~g}, 40 \mathrm{mmol})$. This $\beta$ chloroamine is very volatile. Therefore, concentration on the rotary evaporator (bath temperature: $30^{\circ} \mathrm{C}$ ) was limited to a few minutes: the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum consequently shows the presence of some residual $\mathrm{Et}_{2} \mathrm{O}$. Concentration afforded 1.26 g of colourless oil. Yield: 59\%.
The $\beta$-chloroamine is not stable and should be stored at $0^{\circ} \mathrm{C}$ and used within 24 h (after prolonged storage a white precipitate appears, presumably indicating internal cyclisation to the corresponding aziridinium).
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 270 \mathrm{MHz}\right) \delta_{H}=3.49\left(\mathrm{t},{ }^{3} J_{2-\mathrm{H}, 1-\mathrm{H}}=6.8 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right) 2.57\left(\mathrm{t},{ }^{3} J_{1-\mathrm{H}, 2-\mathrm{H}}=6.8 \mathrm{~Hz}\right.$, $\left.1-\mathrm{H}_{2}\right), 2.21\left(\mathrm{~s}, \mathrm{NMe}_{2}\right){ }^{13} \mathbf{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right) \delta_{H}=61.0(\mathrm{C}-1), 45.5\left(\mathrm{NMe}_{2}\right), 41.7(\mathrm{C}-$ 2).

### 1.2.2. $N$-(2-chloroethyl)-piperidine (7ca)

* CARE! $\beta$-chloroamines are known to have a high toxicity. They should be handled in a fumehood only, and with appropriate care.
(Described in literature ${ }^{[8]}$ ) Prepared according to general procedure GP2. Prepared according to general procedure GP2, using $N$-(2-Chloroethyl)piperidine $\cdot \mathrm{HCl}(3.68 \mathrm{~g}, 20 \mathrm{mmol})$ and ( $4.15 \mathrm{~g}, 30 \mathrm{mmol}$ ). Concentration on the rotary evaporator (bath temperature: $30^{\circ} \mathrm{C}$ ) afforded 2.79 g of colourless oil. Yield: $94 \%$.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta_{H}=3.57\left(\mathrm{t},{ }^{3} J_{2-\mathrm{H}, 1-\mathrm{H}}=7.5 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right), 2.68\left(\mathrm{t},{ }^{3} J_{1-\mathrm{H}, 2-\mathrm{H}}=7.5 \mathrm{~Hz}\right.$, $\left.1-\mathrm{H}_{2}\right), 2.52-2.33\left(\mathrm{~m}, 2^{\prime}-\mathrm{H}_{2}\right.$ and $\left.6^{\prime}-\mathrm{H}_{2}\right), 1.63-1.52\left(\mathrm{~m}, 3^{\prime}-\mathrm{H}_{2}\right.$ and $\left.5^{\prime}-\mathrm{H}_{2}\right), 1.49-1.35\left(\mathrm{~m}, 4^{\prime}-\mathrm{H}_{2}\right)$;

[^1]${ }^{13} \mathbf{C}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 101 \mathrm{MHz}\right): \delta_{C}=60.8(\mathrm{C}-1), 54.7\left(\mathrm{C}-2^{\prime}, \mathrm{C}-6\right.$ '), $41.2(\mathrm{C}-2), 26.0\left(\mathrm{C}-3^{\prime}, \mathrm{C}-\right.$ 5'), 24.3 (C-4').

### 1.2.3. $N$-(2-chloroethyl)-pyrrolidine (7da)

* CARE! $\beta$-chloroamines are known to have a high toxicity. They should be handled in a fumehood only, and with appropriate care.
(Described in literature ${ }^{[8]}$ ) Prepared according to general procedure GP2, using $N$-(2Chloroethyl)pyrrolidine $\cdot \mathrm{HCl}(3.40 \mathrm{~g}, 20 \mathrm{mmol})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(4.15 \mathrm{~g}, 30 \mathrm{mmol})$. Concentration on the rotary evaporator (bath temperature: $30^{\circ} \mathrm{C}$ ) afforded 2.47 g of colourless oil. Yield: $92 \%$.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 270 \mathrm{MHz}\right) \delta_{H}=3.59\left(\mathrm{t},{ }^{3} J_{2-\mathrm{H}, 1-\mathrm{H}}=7.0 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right), 2.82\left(\mathrm{t},{ }^{3} J_{1-\mathrm{H}, 2-\mathrm{H}}=7.0 \mathrm{~Hz}\right.$, $\left.1-\mathrm{H}_{2}\right), 2.60-2.52\left(\mathrm{~m}, 2^{\prime}-\mathrm{H}_{2}\right.$ and $\left.5^{\prime}-\mathrm{H}_{2}\right), 1.82-1.75\left(\mathrm{~m}, 3^{\prime}-\mathrm{H}_{2}\right.$ and $\left.4^{\prime}-\mathrm{H}_{2}\right) ;{ }^{13} \mathbf{C}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}\right.$, $101 \mathrm{MHz}): \delta_{C}=58.1(\mathrm{C}-1), 54.3\left(\mathrm{C}-2^{\prime} / \mathrm{C}-5^{\prime}\right), 42.7(\mathrm{C}-2), 23.6$ (C-3'/C-4'); HRMS (ESI, pos., $\left.\mathrm{CH}_{3} \mathrm{CN}\right)$, calcd. for $\mathrm{C}_{6} \mathrm{H}_{13} \mathrm{ClN}^{+}\left([\mathrm{M}+\mathrm{H}]^{+}\right): m / z=134.0731$, found: 134.0743 .

## 1.3. $\alpha$-chloroamides from $\alpha$-chloroacetyl chloride

### 1.3.1. General procedure GP3: 2-Chloro- $N, N$-diisobutylacetamide

To an ice-cooled solution of $\alpha$-chloroacetyl chloride ( $3.98 \mathrm{~mL}, 50 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{~mL})$ was added $i-\mathrm{Bu}_{2} \mathrm{NH}(6.15 \mathrm{~mL}, 35 \mathrm{mmol})$ dropwise, followed by $\mathrm{Et}_{3} \mathrm{~N}(4.90 \mathrm{~mL}, 35 \mathrm{mmol})$. After stirring at room temperature for 8 h , the reaction mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{~mL})$, washed with aq. $\mathrm{HCl}(1 \mathrm{M}, 40 \mathrm{~mL})$, then with sat. aq. $\mathrm{NaHCO}_{3}(15 \mathrm{~mL})$, and finally with brine ( 30 mL ).
The organic layer was separated and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Concentration in vacuo afforded the known amide ${ }^{[9]}$ as an amber oil ( 7.05 g ), of sufficient purity as determined by ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$ NMR. Yield: 98\%.
IR $\left(\mathrm{CHCl}_{3}\right): v=2960,2930,2875,1650,1460,1390,1370,1125,1100 \mathrm{~cm}^{-1} ;{ }^{1} \mathbf{H}-\mathbf{N M R}$ $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta_{H}=4.08\left(\mathrm{~s}, 2-\mathrm{H}_{2}\right), 3.20\left(\mathrm{~d},{ }^{3} J=7.6 \mathrm{~Hz}\right)$ and $3.13\left(\mathrm{~d},{ }^{3} J=7.6 \mathrm{~Hz}\right)(2$ sets of $1^{\prime}-\mathrm{H}_{2}$ due to anisotropy), $2.03(\mathrm{spt}, J=7.1 \mathrm{~Hz})$ and $1.93(\mathrm{spt}, J=6.90 \mathrm{~Hz})\left(2\right.$ distinct $2^{\prime}-\mathrm{H}$ due to anisotropy), $0.92(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H})$ and $0.88(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 6 \mathrm{H})\left[2\right.$ sets of $2{ }^{\prime}-\left(\mathrm{CH}_{3}\right)_{2}$ due to anisotropy]; ${ }^{13} \mathbf{C - N M R}\left(\mathrm{CDCl}_{3}, 101 \mathrm{MHz}\right) \delta_{C}=167.2(\mathrm{C}-1), 55.8$ and $53.1(\mathrm{C}-1$ 'a and $\mathrm{C}-1$ 'b), 41.5 (C-2), 27.9 and 26.4 (C-2'a and C-2'b), 20.2 ( $2^{\prime}-\mathrm{Me}_{2}$ ); Anal. calcd. for $\mathrm{C}_{10} \mathrm{H}_{20} \mathrm{ClNO}: \mathrm{C} 58.38 \%$, H $9.80 \%$, N $6.81 \%$, found C $58.10 \%$, H $9.77 \%$, N $6.77 \%$.

### 1.3.2. 2-Chloro- $\mathrm{N}, \mathrm{N}$-dibenzylacetamide

To an ice-cooled solution of $\alpha$-chloroacetyl chloride ( $3.98 \mathrm{~mL}, 50 \mathrm{mmol}$ ) in THF ( 100 mL ) was added $\mathrm{Bn}_{2} \mathrm{NH}\left(9.61 \mathrm{~mL}\right.$, 50 mmol ) dropwise, followed by $\mathrm{Et}_{3} \mathrm{~N}(6.97 \mathrm{~mL}, 50 \mathrm{mmol})$. After stirring at room temperature for 8 h , the reaction mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}$ ( 100 mL ), washed with aq. $\mathrm{HCl}(1 \mathrm{M}, 75 \mathrm{~mL})$, then with sat. aq. $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$, and finally with brine ( 30 mL ).
The organic layer was separated and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Concentration in vacuo afforded the known amide ${ }^{[9]}$ as an amber oil ( 13.11 g ), of sufficient purity as determined by ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$ NMR. Yield: 96\%.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 270 \mathrm{MHz}\right) \delta_{H}=7.38-7.08(\mathrm{~m}, 2 \times \mathrm{Ph}), 4.57(\mathrm{~s})$ and $4.46(\mathrm{~s})\left(2 \times \mathrm{CH}_{2} \mathrm{Ph}\right)$, $4.10\left(\mathrm{~s}, 2-\mathrm{H}_{2}\right) ;{ }^{13} \mathbf{C}-\mathbf{N M R}\left(\mathrm{CDCl}_{3}, 101 \mathrm{MHz}\right): \delta_{C}=167.4(\mathrm{C}-1), 136.5,135.8(2 \times \mathrm{C}-1$ ) $)$, 129.2, 128.8, 128.3, $126.5\left(2 \times \mathrm{C}-2^{\prime} / \mathrm{C}-6^{\prime}\right.$ and $\left.2 \times \mathrm{C}-3^{\prime} / \mathrm{C}-5^{\prime}\right)$, 128.1, $127.8\left(2 \times \mathrm{C}-4^{\prime}\right)$, 50.4, $48.7\left(2 \times \mathrm{CH}_{2} \mathrm{Ph}\right), 41.5(\mathrm{C}-2)$.

## 1.4. $\mathrm{BH}_{3} . \mathrm{Me}_{2} \mathrm{~S}$ Reduction of $\alpha$-chloroamides

### 1.4.1. General procedure GP4: $N$-(2-chloroethyl)- $N, N$-diisobutylamine (7ea)

* CARE! Dimethyl sulphide is malodorous, $\beta$-chloroamines are toxic. Work in a fumehood, neutralise glassware with commercial bleach solution.
To a solution of the amide ( $5.00 \mathrm{mmol}, 1.03 \mathrm{~g}$ ) in THF ( 20 mL ), cooled at $0-5^{\circ} \mathrm{C}$ with an ice bath, was added $\mathrm{BH}_{3} . \mathrm{SMe}_{2}(1.19 \mathrm{~mL}, 2.5 \mathrm{mmol}, 2.5 \mathrm{eq}$.$) . After 15 \mathrm{~min}$., the ice bath was removed and the mixture was stirred at r.t. overnight.
To the ice-cooled reaction mixture was carefully added aq. $\mathrm{HCl}(2 \mathrm{~m})$ dropwise until a clear solution was obtained and gas evolution stopped.* The mixture was then basified by addition of aq. $\mathrm{NaOH}(2 \mathrm{M})$ and diluted with $\mathrm{Et}_{2} \mathrm{O}(25 \mathrm{~mL})$. The layers were separated and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 20 \mathrm{~mL})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated* in vacuo to afford the $\beta$-chloroamine ( 0.95 g ) as a colourless oil. Yield: 99\%.
(Described in literature ${ }^{[10]}$ )
${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta_{H}=3.47\left(\mathrm{t},{ }^{3} J_{2-\mathrm{H}, 1-\mathrm{H}}=7.6 \mathrm{~Hz}, 2-\mathrm{H}_{2}\right), 2.71\left(\mathrm{t},{ }^{3} J_{1-\mathrm{H}, 2-\mathrm{H}}=7.6 \mathrm{~Hz}\right.$, $\left.1-\mathrm{H}_{2}\right), 2.15\left(\mathrm{~d},{ }^{3} J_{1^{\prime}-\mathrm{H} 2,2^{\prime}-\mathrm{H}}=7.3 \mathrm{~Hz}, 1^{\prime}-\mathrm{H}_{2}\right), 1.66\left(\mathrm{th},{ }^{3} J_{2^{\prime}-\mathrm{H}, 1^{\prime}-\mathrm{H} 2}={ }^{3} J_{2^{\prime}-\mathrm{H}, 2^{\prime}-\mathrm{CH} 3}=6.7 \mathrm{~Hz}, 2^{\prime}-\mathrm{H}\right)$,

### 1.4.2. $N$-(2-chloroethyl)- $N, N$-dibenzylamine (7fa)

* CARE! Dimethyl sulphide is malodorous, $\beta$-chloroamines are toxic. Work in a fumehood, neutralise glassware with commercial bleach solution.
To a solution of the amide ( $2.74 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) in THF ( 20 mL ), cooled at $0-5^{\circ} \mathrm{C}$ with an ice bath, was added $\mathrm{BH}_{3} . \mathrm{SMe}_{2}(2.38 \mathrm{~mL}, 25.0 \mathrm{mmol}, 2.5 \mathrm{eq}$.). After 15 min ., the ice bath was removed and the mixture was stirred at r.t. overnight.
The ice-cooled reaction mixture was acidified with aq. $\mathrm{HCl}(6 \mathrm{~m})$ dropwise until a clear solution was obtained and gas evolution stopped. Basification with $\mathrm{NaOH}(2 \mathrm{~m})$ and extraction with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ afforded the crude chloroamine as a mixture with the starting chloroamide ( 2.55 g ). After flash chromatography $\left(\mathrm{SiO}_{2},{\left.\mathrm{PE}: \mathrm{Et}_{2} \mathrm{O}: \mathrm{Et}_{3} \mathrm{~N}=1: 1: 0.1\right) \text {, the }}^{2}\right.$ title compound ( 4.75 mmol ) was obtained as a pale yellow oil. Yield: $47 \%$.

### 1.5.Epoxidation of alkenes with mCPBA

1.5.1. General procedure GP5: Cyclohexyl oxirane (rac. 3c)

To an ice-cooled solution of vinylcyclohexane (Alfa Aesar, $98+\%, 2.20 \mathrm{~g}, 20.0 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ was added dried $m$ CPBA ( $82 \mathrm{wt} .-\%, 5.26 \mathrm{~g}, 25.0 \mathrm{mmol}$ ). After 15 min , the ice bath was removed and the reaction stirred at room temperature for 24 h . After dilution with pentane ( 100 mL ), the suspension was filtered over a short ( 3 cm ) plug of $\mathrm{Al}_{2} \mathrm{O}_{3}$ (neutral, $\varnothing=2.5 \mathrm{~cm}$ ). Removal of the solvents under reduced pressure afforded cyclohexyl oxirane $(2.14 \mathrm{~g})$ as a clear, colourless, and fruity-smelling oil. It was used without further

### 1.8. General procedure GP8: $\boldsymbol{N}$-oxidation of tertiary $\boldsymbol{\beta}$-chloroamines with $m C P B A$

Dried $m$ CPBA (prepared according to GP1 and titrated according to ref. ${ }^{[7]}$, usually containing $5-15 \%$ residual chlorobenzoic acid, 1.1-1.5 eq.) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (to obtain an approximately 0.2 M solution). To this solution, cooled with an ice-brine bath, was added the amine slowly (approximately $1 \mathrm{~mL} / \mathrm{min}$ ) via syringe. The mixture was then stirred while being allowed to warm up to room temperature. After 2 to 12 h , consumption of the starting amine was completely as shown by TLC of a basified aliquot of the reaction mixture (Eluent $\mathrm{PE} / \mathrm{Et}_{2} \mathrm{O} / \mathrm{Et}_{3} \mathrm{~N}$ : 1:1:0.1). The solvent was removed under reduced pressure to yield quantitative amounts of the $m$-chlorobenzoic acid salt (8) of the $\beta$-chloroamine $N$-oxide as a brown oil. In all cases, excess $m$-chlorobenzoic acid was the main contaminant; the excess of $m$-chlorobenzoic acid was assessed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ to be between 0.2 and 0.7 eq. The highly hygroscopic nature of these salts (8) limits their suitability for combustion analysis.

### 1.9. General procedure GP9: Enamine $N$-oxides by dehydrochlorination of $\beta$-chloroamine $N$-oxides

To a suspension of KOtBu ( 4 eq .) in THF ( 0.6 M ), cooled with an ice-brine bath to $-5-0^{\circ} \mathrm{C}$, was added dropwise via syringe a solution of the $m$-chlorobenzoic acid salt of $\beta$-chloroamine $N$-oxide (obtained by GP8) in THF ( 0.2 M ). The mixture was then stirred while being allowed to warm up to room temperature. After 7 to 12 h , consumption of the starting amine was complete as shown by TLC $\left(\mathrm{SiO}_{2}\right.$, Eluent $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}: 80 / 20$, staining with a $5 \mathrm{wt} . \%$ solution of 2,3,5-Triphenyltetrazolium chloride in $i \mathrm{PrOH}$ ). The THF was removed under reduced pressure. The resulting solid was triturated in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (potassium chlorobenzoate is only sparingly soluble in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and filtered over plug of Celite ${ }^{\circledR}$, or alternatively triturated in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(80 / 20)$ and filtered over a short plug of neutral alumina (potassium chlorobenzoate does not elute on alumina). Concentration under reduced pressure afforded the crude enamine $N$-oxide, which was further purified by flash chromatography ( $\mathrm{SiO}_{2}$,
$\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ from $95 / 5$ to $70 / 30$ ). This afforded enamine $N$-oxides as crystalline products, that rapidly became oily if exposed to atmospheric moisture. (In which case co-evaporation with $\mathrm{CHCl}_{3}$ at the rotary evaporator removed most residual MeOH and water and yielded a crystalline product again.) The highly hygroscopic nature of these compounds limits their suitability for combustion analysis. Typical yield: $55-65 \%$ based on the starting $\beta$ chloroamine $N$-oxide salt.

### 1.9.1. $N, N$-Dimethylvinylamine $N$-oxide (1aa)

Prepared according to GP9, starting from $\mathrm{KOtBu}(6.72 \mathrm{~g}, 60.0 \mathrm{mmol}, 3 \mathrm{eq}$.) and $\mathbf{8 a a}(5.98 \mathrm{~g}$, 20.0 mmol ). After 7h, work-up followed by chromatography $\left(\mathrm{SiO}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right.$ gradient from $90: 10$ to $70: 30$ ) and co-evaporation with $\mathrm{CHCl}_{3}$ at the rotary evaporator to remove excess MeOH afforded $\mathbf{1 a a}(1.06 \mathrm{~g})$ as a crystalline product. Yield: $60 \%$.

Crystal structure determination: The asymmetric unit of this structure contains four independent molecules, and their pseudosymmetric relationship leads to systematic weaknesses in the diffraction dataset. Two of the molecules exhibit disorder in their phenyl rings, while the other two molecules have disorder of their oxygen atoms (attached to N ).

The phenyl ring disorder affects the $2,3,5,6$ positions and this was modelled by allowing elongated ellipsoids to model a torsional mode of disorder. A model which allowed up to three alternative sites for each affected atom shows no advantages. These ellipsoids lead to a number of checkCIF Alerts but these are consistent with the model being used.

The disorder of the two oxygen atoms O 21 and O 31 was modelled by using two alternative sites for each atom and then refining occupancies competitively. Similarity restraints were applied among the molecules and disorder components and the $\mathrm{N}-\mathrm{O}$ distances were restrained to be equal within $0.01 \AA$. The occupancies converged to around 0.5 . The final $\mathrm{N}-\mathrm{O}$ distances of around $1.39 \AA$ are close to values in the literature $(1.36 \pm 0.03 \AA$ for trimethylamine N -oxide). ${ }^{[20]}$

### 1.9.7. cis-1-(2-chlorocyclohexyl)pyrrolidine $N$-oxide (1dx)

To a solution of $m \mathrm{CPBA}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{~m}, 3.20 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added the cis $\beta$-chloroamine cis-7dx ( $100 \mathrm{mg}, 0.533 \mathrm{mmol}$ ). The mixture was stirred 8 h at room temperature, the concentrated in vacuo. The residual oil was dissolved in THF ( 5 mL ) and added dropwise to a suspension of $\mathrm{KOtBu}\left(240 \mathrm{mg}, 2.13 \mathrm{mmol}, 4\right.$ eq.) in THF ( 5 mL ) at $0^{\circ} \mathrm{C}$, then the reaction mixture was allowed to warm up to room temperature slowly and stirred for 7 h . The THF was removed under reduced pressure. The resulting gel was triturated in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ and filtered over plug of celite. Concentration under reduced pressure afforded the crude enamine $N$-oxide, which was further purified by flash chromatography $\left(\mathrm{SiO}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}\right.$ from $95 / 5$ to $70 / 30$ ). This afforded the enamine $N$-oxide $\mathbf{1 d x}$ contaminated with approx. 1.70 eq. of 3 -chlorobenzoic acid as a clear, colourless oil ( 126 mg ). Yield: $55 \%$ based on the starting $\beta$ chloroamine.

$\mathrm{CH}_{3} \mathrm{CN}, 40^{\circ} \mathrm{C}, 2 \mathrm{~h}$

To a solution of $\mathbf{8 d d}(225 \mathrm{mg}, 0.50 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(7 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(207 \mathrm{mg}, 1.50$ $\mathrm{mmol}, 3.0$ eq.). The suspension was stirred for 2 h at $40^{\circ} \mathrm{C}$. After cooling down to room temperature, the mixture was diluted with EtOAc ( 10 mL ), filtered over Kieselguhr, and concentrated under reduced pressure. The residual oil was purified by flash chromatography $\left(\mathrm{SiO}_{2}, \mathrm{PE}: \mathrm{Et}_{2} \mathrm{O}=5: 1\right)$ to yield a first fraction of $11 \mathrm{dd}(12.5 \mathrm{mg} ; 10 \%)$ as a light brown oil (this sample was unstable. NMR after 1 day at room temperature showed significant decomposition to unidentified species. The main peak in ESI-MS was [M-Cl]+, expectably indicating that the opening of the 'Owari" oxazetidinium intermediate by chloride anions is a reversible process) and a second fraction of $\mathbf{1 2 d d}(109 \mathrm{mg} ; 58 \%)$ as a light brown oil.

### 2.1.1. trans-1-benzyl-1-(2-hydroxycyclohexyl)pyrrolidinium chloride (rac. trans-13)

To a solution of aminoalcohol ( $10 \mathrm{mmol}, 1.69 \mathrm{~g}$ ) in toluene ( 20 mL ) was added benzyl chloride ( $1.15 \mathrm{~mL}, 10 \mathrm{mmol}, 1 \mathrm{eq}$.). The mixture was refluxed for 12 h . After cooling to room temperature, the mixture was concentrated in vacuo and recrystallized from $\mathrm{Et}_{2} \mathrm{O}$ to yield the $\beta$-hydroxyammonium chloride ( $1,71 \mathrm{~g}, 58 \%$ ) as white crystals.

2.1.2. cis-1-(2-chlorocyclohexyl)pyrrolidine (rac.cis-7dx)

The starting $\beta$-hydroxyammonium chloride ( $592 \mathrm{mg}, 2 \mathrm{mmol}$ ) was dissolved in $\mathrm{CHCl}_{3}$ ( 10 mL ) and the solution was cooled with an ice-water bath. Thionyl chloride ( $0.19 \mathrm{~mL}, 2.6$ eq.) was added dropwise. The mixture was stirred over night, then the excess thionyl chloride was destroyed by adding $\mathrm{MeOH}(5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. After stirring for 1 h , then volatiles were removed in vacuo. (NMR analysis at this point showed a complex mixture of products) The residual oil was dissolved in $\mathrm{MeOH}(10 \mathrm{~mL})$, and $\mathrm{K}_{2} \mathrm{CO}_{3}(3 \mathrm{~g})$ was added. The mixture was degassed by 2 cycles of vacuum $/ \mathrm{N}_{2}$-flushings, then Palladium on charcoal ( $10 \% \mathrm{wt}$., $5 \mathrm{~mol}-\%, 106 \mathrm{mg}$ ) was added. The mixture was degassed again by 2 cycles of vacuum $/ \mathrm{N}_{2}$-flushings, then a ballon of hydrogen gas was fitted to the flask and the reaction was left to stir at room temperature over 12h. After filtration over celite, concentration in vacuo and flashchromatography ( $\mathrm{PE}: \mathrm{Et}_{2} \mathrm{O}=5: 1$ ), the cis $\beta$-chloroamine cis- $7 \mathbf{d x}$ was obtained $(112 \mathrm{mg})$ as a clear oil. Yield: 30\%.
