## General Methods

All melting points were determined on a Kofler hot-plate melting point apparatus and are uncorrected. Infrared (IR) spectra were recorded neat or as nujol emulsions on a Nicolet Impact 400 spectrophotometer. ${ }^{1} \mathrm{H}-,{ }^{31} \mathrm{P}$ - and ${ }^{13} \mathrm{C}$-NMR spectra were recorded at 298 K on a Varian Unity 300 or a Bruker Avance $300\left(300,121\right.$ and 75 MHz for ${ }^{1} \mathrm{H},{ }^{31} \mathrm{P}$ and ${ }^{13} \mathrm{C}$, respectively) or on a Bruker Avance 400 (400, 161 and 100 MHz for ${ }^{1} \mathrm{H},{ }^{31} \mathrm{P}$ and ${ }^{13} \mathrm{C}$, respectively). Chemical shifts are expressed in ppm, relative to $\mathrm{Me}_{4} \mathrm{Si}$ at $\delta=$ 0.00 ppm for ${ }^{1} \mathrm{H}$, while the chemical shifts for ${ }^{13} \mathrm{C}$ are reported relative to the resonance of $\mathrm{CDCl}_{3} \delta=77.10 \mathrm{ppm} .{ }^{31} \mathrm{P}$ chemical shifts were externally referenced to $85 \%$ aqueous phosphoric acid. Abbreviations of coupling patterns are as follows: s, singlet; d,
doublet; t , triplet; q , quadruplet. Other abbreviations: q , quaternary carbon. Mass spectra were recorded on a Hewlett-Packard 5993C spectrometer (EI) or on a VG-Autospec spectrometer $\left(\mathrm{FAB}^{+}\right)$. Microanalyses were performed on a Carlo Erba EA-1108 instrument.

## Materials

Diethyl 1,4-phenyldimalonate (4), ${ }^{1}$ benzyl chloromethyl ether, ${ }^{2}$ and tris(5-azido-2bromobenzyl)amine (9) ${ }^{3}$ were prepared by published procedures.

## Synthesis of $\left[\left(\mathrm{Ph}_{2} \mathrm{PCH}_{2}\right)_{3} \mathrm{CCH}_{2}\right]_{2} \mathrm{O}$ (S2)

Hexachloride S1: Thionyl chloride ( $4.5 \mathrm{~mL}, 58 \mathrm{mmol}$ ) was added dropwise to a suspension of dipentaerythritol ( $2.0 \mathrm{~g}, 7.86 \mathrm{mmol}$ ) in pyridine $(5 \mathrm{~mL})$ at $\mathrm{rt}{ }^{\circ} \mathrm{C}$. The reaction was heated at $50^{\circ} \mathrm{C}$ for 3 h and then at $115^{\circ} \mathrm{C}$ for 2 h . After cooling, the mixture was poured into ice ( 20 g ) and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 3 x 40 ml ). The combined organic extracts were washed with a saturated $\mathrm{NaHSO}_{4}$ solution and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under reduced pressure and the resulting residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ and filtered through a silica pad (15 g) to give hexachloride S1. ## Molecular Modelling Structures of Hexaphosphazenes 12

12A
( $M, M, M, M)$

12B
( $M, M, P, P$ )

Note: One of the macrobicyclic moieties of each isomer is drawn in green color for showing neatly the helical sense of both propellers in each structure. The conventional assignment of the stereochemical descriptor $P$ or $M$ (helical twist sense) to the tripodal units of $\mathbf{1 2}$ has been made by looking at the molecule along its propeller axis from the side of one of the tribenzylamine fragments.

## Calculation details of the activation energies for the exchange $12 \mathrm{~A} \rightleftharpoons 12 \mathrm{~B}$

During our VT-NMR experiment (193-373 K) we did not observe significant variations respect to the obtained ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectra of the mixture $\mathbf{1 2 A}+\mathbf{1 2 B}$ at room temperature in deuterated toluene, thus suggesting that free energy barrier, $\Delta G^{\neq}(\mathrm{A})$ and $\Delta G^{\neq}(\mathrm{B})$ (Figure S 1 ), for the exchange $\mathbf{1 2} \mathrm{A} \rightleftharpoons \mathbf{1 2 B}$ could have a considerable value. A schematic representation of the potential energy plot for these transformations is shown in Figure S1.

Figura S1. Potential energy plot for the exchange $\mathbf{1 2 A} \rightleftharpoons \mathbf{1 2 B}$.

We use the graphic method of Shaman-Atidi y Bar-Eli ${ }^{4}$ to estimate the activation energies $\Delta G^{\nexists}(\mathrm{A})$ and $\Delta G^{\nexists}(\mathrm{B})$ of a equilibration process involving two diastereoisomers with different concentrations and when the exchange between each other is slow. In order to carry out this calculation is taken a value of $\Delta v=38.64 \mathrm{~Hz}$ for the distance in hertz of the ascribed resonances to the protons of $p$-phenylene linker in each diasteroisomer. $T_{c}$ was the highest temperature that we can reach in toluene. Since no coalescence process was observed, the activation energies $\Delta G^{\neq}(\mathrm{A})$ and $\Delta G^{\neq}(\mathrm{B})$ values should be even more higher than the obtained ones by this approximation.

The following equations E1 and E2 were used to obtain the activation parameters for these processes:

$$
\begin{align*}
& \Delta G^{\neq}(\mathrm{A})=4.57 \mathrm{~T}_{\mathrm{c}}\left[10.62+\log \frac{\mathrm{x}}{2 \pi(1-\Delta \mathrm{P})}+\log \frac{\mathrm{T}_{\mathrm{c}}}{\Delta \mathrm{v}}\right]  \tag{E1}\\
& \Delta G^{\neq}(\mathrm{B})=4.57 \mathrm{~T}_{\mathrm{c}}\left[10.62+\log \frac{\mathrm{x}}{2 \pi(1+\Delta \mathrm{P})}+\log \frac{\mathrm{T}_{\mathrm{c}}}{\Delta \mathrm{v}}\right] \tag{E2}
\end{align*}
$$

According to the Shaman-Atidi and Bar-Eli plot (Figure 2), for a difference in relative concentrations of $\mathbf{1 2 A}$ and $\mathbf{1 2 B}, \Delta \mathrm{P}$, of 0.2 corresponds the values of $\log [\mathrm{x} /$ $2 \pi(1 \pm \Delta \mathrm{P})],-0.43$ and $-0.60 . \Delta \mathrm{P}$ value was obtained from integration ratio (3:2) of the ${ }^{1} \mathrm{H}$ NMR signals of the protons of $p$-phenylene linker in each diasteroisomer [ $\Delta \mathrm{P}=(3-$ 2)/5]. Introducing these values in the equations E1 and E2 were obtained in turn the
values of 19.05 y $18.75 \mathrm{kcal} \cdot \mathrm{mol}^{-1}$ for $\Delta G^{\neq}(\mathrm{A})$ and $\Delta G^{\nexists}(\mathrm{B})$, respectively.

Figure S2. Plot of $\log [x / 2 \pi(1 \pm \Delta \mathrm{P})]$ versus $\Delta \mathrm{P}$ (see equations E1 and E2)

From this estimation is possible to calculate a difference in free energy between both diastereoisomers of only $0.3 \mathrm{kcal} \cdot \mathrm{mol}^{-1}$ at 373 K . From these results it is derived that the energy of both isomers are very close at the ground state.
