General considerations: Melting points were determined on a Reichert hot stage apparatus. Infrared spectra were recorded on a Perkin-Elmer 1600 FTIR spectrometer or on a Nicolet Avatar 320 FT-IR as neat or in solutions. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AM 400 NMR spectrometer or on a VARIAN Mercury plus 300 instrument as solutions in $\mathrm{CDCl}_{3}$, using residual protic solvent $\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}}=7.27 \mathrm{ppm}\right)$ or $\mathrm{CDCl}_{3}\left(\delta_{\mathrm{C}}=77.0 \mathrm{ppm}\right)$ as internal reference. Mass spectra were determined on a Hewlett Packard HP 5970B/5890A or on a Micromass (Manchester, United-Kingdom) Quattro LC spectrometer (ESI). All reactions were monitored by TLC carried out on 0.2 mm aluminium silica gel ( $60 \mathrm{~F}_{254}$ ) pre-coated plates using UV light and 5\% ethanolic phosphomolybdic acid and heat as developing agent. Flash chromatography was performed on 40-63 $\mu \mathrm{m}$ (400-230 mesh) silica gel 60 with ethyl acetate (EtOAc)-petroleum ether (PE) (bp. $40-60^{\circ} \mathrm{C}$ ) or cyclohexane as eluents. Commercially available reagents and solvents were purified and dried when necessary by usual methods. THF and $\mathrm{Et}_{2} \mathrm{O}$ were purified by distillation, under nitrogen, from sodium / benzophenone. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was dried by distillation from calcium hydride. Unless otherwise mentioned, all other reagents were purchased from commercial sources and were used without further purification.

The residue was extracted with EtOAc $(3 \times 3 \tilde{0} \mathrm{~mL})$ and the combined organic extracts washed with brine $(200 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure to furnish the crude methyl ester as a slightly yellow solid ( $25.8 \mathrm{~g}, 101.6 \mathrm{mmol}, 91 \%$ ). To a solution of the methyl ester ( $25.8 \mathrm{~g}, 101.6 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(254 \mathrm{~mL})$ was added at room temperature under argon $\alpha, \alpha$ dichloromethyl methyl ether ( $27.43 \mathrm{~mL}, 304.8 \mathrm{mmol}$ ). This mixture was cooled to $-70^{\circ} \mathrm{C}$ and neat $\mathrm{SnCl}_{4}(11.68 \mathrm{~mL}, 101.6 \mathrm{mmol})$ was added dropwise. The resulting yellow reaction mixture was warmed slowly to $0^{\circ} \mathrm{C}(2 \mathrm{~h})$ and water was added dropwise. The mixture was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(500 \mathrm{~mL})$ and neutralized with saturated sodium bicarbonate solution and solid $\mathrm{NaHCO}_{3}$. The phases were separated and the aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 500 \mathrm{~mL})$. The combined organic extracts were washed with brine $(500 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. The crude product
was purified by chromatography on silica gel (cyclohexane/EtOAc 4:1) to give 27 g (95.7 $\mathrm{mmol}, 85 \%$ ) of $\mathbf{7}$ as a white solid. $\mathbf{R}_{\mathrm{f}} 0.4$ (cyclohexane/EtOAc 4:1).
