## 1. Methods and Materials

Unless otherwise stated, commercially available reagents were used as purchased without further purification. Before use, solvents were refluxed in the presence the appropriate drying agent and distilled under nitrogen: tetrahydrofuran (THF) from potassium, dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), 1,2$ dichloroethane and diethylether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ from $\mathrm{CaH}_{2}$. Diisopropylamine and triethylamine $\left(\mathrm{Et}_{3} \mathrm{~N}\right)$ were distilled from $\mathrm{CaH}_{2}$ and stored over $3 \AA$ molecular sieves. Ethanol was distilled from sodium and stored over activated $3 \AA$ molecular sieves. Methanol was distilled from magnesium and stored over activated $3 \AA$ molecular sieves. Decane $(99+\%$, ACROS) was used as purchased. $n-\mathrm{Bu}_{2} \mathrm{BOTf}\left(1 \mathrm{M}\right.$ in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ was purchased from FLUKA. Lithium chloride was dried for 12 h at $150{ }^{\circ} \mathrm{C}$ and 0.05 mbar . The concentration of $n-\mathrm{BuLi}$ in hexane was determined employing 4biphenylmethanol as indicator ${ }^{1}$. All moisture-sensitive reactions were performed in flame-dried septum-sealed glassware under an atmosphere of argon. Reagents were transferred by means of syringe or cannula. Glass pressure tubes with a screw-cap were purchased from SIGMAALDRICH (Ace pressure tube, 35 ml , PTFE bushing, FETFE O-ring, type A). Analytical TLC was performed using pre-coated silica gel foils $60 \mathrm{~F}_{254}$ (Merck, 4 cm ). Visualization was achieved using 365 nm ultraviolet irradiation followed by staining with an anisaldehyde reagent (p-anisaldehyde $2.53 \mathrm{vol} \%$, acetic acid $0.096 \mathrm{vol} \%$, ethanol $93.06 \mathrm{vol} \%$, conc. $\mathrm{H}_{2} \mathrm{SO}_{4} 0.034$ vol\%) or with a potassium permanganate reagent ( $3 \mathrm{~g} \mathrm{KMnO}_{4}, 20 \mathrm{~g} \mathrm{~K}_{2} \mathrm{CO}_{3}, 5 \mathrm{~mL} 5 \%$ aqueous $\mathrm{NaOH}, 300 \mathrm{~mL}$ water).

Flash chromatography was performed using silica gel Merck (particle size $0.032-0.063 \mathrm{~mm}$ ) supplied by Merck and mixtures of heptane and ethyl acetate or hexane and ethyl acetate as eluent.
${ }^{1} \mathrm{H}$ NMR spectra were recorded on an ASP-300 (Bruker) at 300.13 MHz or on a DRX-500 (Bruker) spectrometer at 500.13 MHz . Chemical shifts are reported in ppm relative to tetramethylsilane ( $\delta 0 \mathrm{ppm}$ ). Signal splitting pattern are labeled by the following abbreviations: s $=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{br} . \mathrm{s}=$ broad singlet, $\mathrm{sept}=$ septet, $\mathrm{m}=$ multiplet or overlap of non equivalent resonances. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on an ASP-300 (Bruker) at 75.48 MHz or on a DRX-500 (Bruker) spectrometer at 125.77 MHz . Chemical shifts are reported in ppm relative to $\mathrm{CDCl}_{3}(\delta 77.0 \mathrm{ppm})$. The assignment of $\mathrm{C}, \mathrm{CH}, \mathrm{CH}_{2}, \mathrm{CH}_{3}$ is based on DEPT (distortionless enhancement by polarization transfer) experiments. The terms "major" and "minor" are used to distinguish between diastereomers. The assignments of atom connectivity and

[^0]spatial relationships are based on 2D NMR correlation $\left({ }^{1} \mathrm{H} /{ }^{1} \mathrm{H}\right.$-NOESY, ${ }^{1} \mathrm{H} /{ }^{1} \mathrm{H}$-ROESY, ${ }^{1} \mathrm{H} /{ }^{1} \mathrm{H}-$ COSY, ${ }^{1} \mathrm{H} /{ }^{13} \mathrm{C}$-HMBC and ${ }^{1} \mathrm{H} /{ }^{13} \mathrm{C}$-HSQC). Infrared spectra were recorded as a thin film on a KBr disk ("in substance") on a NICOLET 205 spectrometer. Molecular formula assignment was confirmed by combustion elemental analysis using an Elemental Analyzer EA 1108 (CARLO ERBA INSTRUMENTS). Melting points were measured with a 3306C MELT PT-Electrothermal capillary melting point apparatus.
