## General

${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, 600 \mathrm{MHz}$ ) and ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, 150 \mathrm{MHz}$ ) spectra were recorded on Bruker ARX 400 or JEOL JMN-ECX400 and JMN-ECX600 instruments. Optical rotations were measured with a HORIBA SEPA-300 polarimeter. Column chromatography was performed on silica-gel (Kanto Chemicals, Sillica Gel 60N (spherical, neutral), 40-100 $\mu \mathrm{m}$ ). Recycling preparative HPLC was performed with Japan Analytical Industry LC-918 equipped with GPC columns JAIGEL-1H and 2H. Elemental analysis was performed at the Center for Instrumental Analysis of Hokkaido University. GC analysis was carried out using Agilent GC 6850 equipped with Agilent HP-1 Column (length $30 \mathrm{~m}, 0.32$ mm I.D.). The enantiomeric excess (ee) was determined by GC using Chiraldex G-TA (ASTEC) and HPLC using CHIRALPAK AD-H (DAICEL), CHIRALCEL OD (DAICEL).

## Materials

$\mathrm{CDCl}_{3}$ (Cambridge Isotope Laboratories, Inc.) and DMSO- $d_{6}$ (ACROS) were used as solvent for obtaining NMR spectra. Benzene (Wako Chemicals), THF (Kanto Chemicals), $\mathrm{CHCl}_{3}$ (Wako Chemicals), EtOH (Wako Chemicals) were used spectrochemical analysis grade for measurement of optical rotation. Toluene was dried by distillation with $\mathrm{CaH}_{2}$ before use. 2-Methoxyethanol (Wako Chemicals) was dried by molecular sieves 4A before use. (S)-DTBM-SEGPHOS and
(R)-DTBM-SEGPHOS were provided from Takasago International Corporation. All other chemical reagents were used in commercial grade.

## Synthesis of Substrates

Synthesis of the substrates was summarized by the following scheme.

## Synthesis of $\boldsymbol{N}$-(4-chlorobenzoyl)norleucine

A mixture of DL-norleucine ( $5.45 \mathrm{~g}, 40.0 \mathrm{mmol}$ ) and $\mathrm{KOH}(6.07 \mathrm{~g}, 92.0 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(67 \mathrm{~mL})$ were stirred at $0^{\circ} \mathrm{C}$. ## 

The value of theoretical conversion was calculated by the equation, convn $=\mathrm{ee}_{s} /\left(\mathrm{ee}_{\mathrm{s}}+\mathrm{ee}_{\mathrm{p}}\right)$. The value of experimental conversion was determined as isolated yield of product $\mathbf{2}$ because $\mathbf{2}$ is quite stable under the condition of silica-gel column chromatography while small part of $\mathbf{1}$ is decomposed during the chromatographic isolation. (We confirmed rapid elution suppresses the decomposition in the least amount). The differences in the values between theoretical conversions and experimental conversions were within $\pm 2 \%$ in all cases, and the total yields of 1 and 2 were between $90-100 \%$. In Table S-1, the $k_{\text {rel }}$ values calculated from theoretical conversion and experimental conversion by using eqs (1), (2), (4), and (5) (equations in Figure 1) are listed in 3 digit number. The $k_{\text {rel }}$ values calculated from theoretical
conversion by using eq (1), (4) and the $k_{\text {rel }}$ values calculated from theoretical conversion by using eq (2), (5) became exactly same. However, the $k_{\text {rel }}$ values calculated from experimental conversion by using eq (1), (4) and the $k_{\text {rel }}$ values calculated from theoretical conversion by using eq (2), (5) were varied slightly.

## Determination of absolute configuration of the azlactones and alcoholized products

The absolute configurations of 8 compounds ((-)-1a, (-)-1k, (-)-1g, (-)-1d, (-)-2a, (+)-2d, (-)-2g, and $(+)-\mathbf{2 k})$ were determined. The results suggest optically active unreacted substrates $\mathbf{1}$ obtained by the present kinetic resolution employing (S)-DTBM-SEGPHOS have $S$ configuration. On the other hand, optically active products $\mathbf{2}$ have $R$ configuration.

The absolute configuration of (-)-1a and (-)-1k was determined as $S$ by comparison of the retention time of chiral GLC of $\mathbf{1 a}$ and chiral HPLC of $\mathbf{1 k}$ with that reported in the literature ${ }^{2}$.

## Derivatization of (-)-1g into $N$-benzoyl- $\alpha$-methylserine benzyl ester

4-Methyl-5-oxo-2-phenyl-4,5-dihydrooxazole-4-carboxylic acid benzyl ester ( $40.0 \mathrm{mg}, 0.129 \mathrm{mmol}$, $80 \%$ ee, $(-)-\mathbf{1 g})$ was dissolved in THF ( 1.0 mL ), then cooled to $0{ }^{\circ} \mathrm{C}$. To this was added $\mathrm{NaBH}_{4}(3.0 \mathrm{mg}$, 0.0711 mmol ) and the reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 45 min . To this was added saturated aqueous $\mathrm{NaHCO}_{3}(1 \mathrm{~mL})$, then the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL} x 3)$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and the solvent was removed by rotary evaporation. The residue was purified by silica-gel column chromatography (Hexane/Et $\mathrm{E}_{2} \mathrm{O}=1 / 2$ ) to give the product ( $23.7 \mathrm{mg}, 59 \%,[\alpha]_{\mathrm{D}}{ }^{27}=-4.6^{\circ}(\mathrm{c}=2.37$, $\mathrm{CHCl}_{3}$ )) as colorless oil.
Comparison of the optical rotation of the product with that reported in the literature (81\% ee, $[\alpha]_{\mathrm{D}}{ }^{20}=$ $-4.5^{\circ}\left(\mathrm{c}=1.00, \mathrm{CHCl}_{3}\right)^{2}$ ) confirmed that the absolute configuration is $R$. Consequently, (-)- $\mathbf{1 g}$ was determined as $S$.

## Derivatization of (-)-1d into $N$-benzoyl- $\alpha$-methylserine

$(+)-(R)-N$-benzoyl- $\alpha$-methylserine
4-Methyl-5-oxo-2-phenyl-4,5-dihydrooxazole-4-carboxylic acid allyl ester ( $53.1 \mathrm{mg}, 0.205 \mathrm{mmol}$, $82.7 \%$ ee, (-)-1d) was dissolved in THF ( 1.6 mL ). Then, this solution was cooled to $0{ }^{\circ} \mathrm{C}$, $\mathrm{NaBH}_{4}(4.7$ $\mathrm{mg}, 0.113 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 45 min , then saturated aqueous $\mathrm{NaHCO}_{3}(1 \mathrm{~mL})$ was added. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL} x$ 3), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and the solvent was removed by rotary evaporation. The residue was purified by silica-gel
column chromatography (Hexane/Et $\mathrm{O}_{2} \mathrm{O}=1 / 2$ ) to give $N$-benzoyl- $\alpha$-methylserine allyl ester ( 23.3 mg , $\left.43 \%,[\alpha]_{D}{ }^{27}=-1.3^{\circ}\left(\mathrm{c}=2.33, \mathrm{CHCl}_{3}\right)\right)$ as colorless oil.
Then, 2 M solution of $\mathrm{NaOH}(44.3 \mathrm{~mL}, 0.0885 \mathrm{mmol})$ was added to a solution of this product ( 23.3 mg , 0.0885 mmol ) in methanol ( 1 mL ). This mixture was stirred for 3.5 h at room temperature. $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ was then added, and the methanol was removed by rotary evaporation. The water layer was washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL} x 3)$ and then acidified with $1 \mathrm{M} \mathrm{HCl}(0.5 \mathrm{~mL})$. The product was extracted into $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $10 \mathrm{~mL} x \mathrm{3}$ ) and dried by $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed by rotary evaporation, the crude was purified by recycling preparative HPLC to give $N$-benzoyl- $\alpha$-methylserine ( $1.1 \mathrm{mg}, 5 \%,[\alpha]_{\mathrm{D}}{ }^{27}=+5.8^{\circ}$ (c $=0.11, \mathrm{EtOH})$ ) as white solid.
Comparison of the optical rotation of the product with that reported in the literature $((+)-(R)-$ $N$-benzoyl- $\alpha$-methylserine, $\left.[\alpha]_{\mathrm{D}}{ }^{20}=+1.9^{\circ}(\mathrm{c}=1.00, \mathrm{EtOH})^{3}\right)$ confirmed that the absolute configuration is $R$. Consequently, (-)-1d was determined as $S$.

Optically active (-)-1a, (-)-1d, (-)-1g, and (-)-1k ((S)-isomers) were converted to 2a, 2d, 2g, 2k by $\mathrm{Sc}(\mathrm{OTf})_{3}$ as catalyst, then retention time of chiral HPLC was compared with (-)-2a, $(+)-\mathbf{2 d},(-)-\mathbf{2 g}$, and $(+)-\mathbf{2 k}$, which were obtained by the kinetic resolution. All the charts showed opposite enantiomer is major isomer. Consequently, the absolute configuration of $(-)-\mathbf{2 a},(+)-\mathbf{2 d},(-)-\mathbf{2 g}$, and $(+)-\mathbf{2 k}$ was determined as $R$.

## Introduction of Equations and Graphic Drawing

Equations were derived essentially the same way of Kagan. ${ }^{4}$

$$
\begin{aligned}
& \mathrm{S}_{R} \xrightarrow{k_{R}} \mathrm{P}_{R} \\
& \mathrm{~S}_{\mathrm{S}} \xrightarrow{k_{\mathrm{S}}} \mathrm{P}_{\mathrm{S}}
\end{aligned}
$$

For first order reaction, differential equation becomes as follows.

$$
\left.\begin{array}{r}
-\frac{\mathrm{d}\left[\mathrm{~S}_{R}\right]}{\mathrm{d} t}=k_{1}\left[\mathrm{~S}_{R}\right]  \tag{S1}\\
-\frac{\mathrm{d}\left[\mathrm{~S}_{S}\right]}{\mathrm{d} t}=k_{2}\left[\mathrm{~S}_{S}\right]
\end{array}\right\}
$$

Integration of eqs (S1) gives eqs (S2).

$$
\left.\begin{array}{l}
{\left[\mathrm{S}_{R}\right]=\left[\mathrm{S}_{R}\right]_{0} \mathrm{e}^{-k_{1} t}}  \tag{S2}\\
{\left[\mathrm{~S}_{S}\right]=\left[\mathrm{S}_{S}\right]_{0} \mathrm{e}^{-k_{2} t}}
\end{array}\right\}
$$

The combination of eqs (S2) leads to eq (S3).

$$
\begin{equation*}
\frac{k_{1}}{k_{2}}=\frac{\ln \left(\left[\mathrm{S}_{R}\right] /\left[\mathrm{S}_{R}\right]_{0}\right)}{\ln \left(\left[\mathrm{S}_{S}\right] /\left[\mathrm{S}_{S}\right]_{0}\right)} \tag{S3}
\end{equation*}
$$

For zeroth order reaction, differential equation becomes as follows.

$$
\left.\begin{array}{rl}
-\frac{\mathrm{d}\left[\mathrm{~S}_{R}\right]}{\mathrm{d} t} & =k_{1} \\
-\frac{\mathrm{d}\left[\mathrm{~S}_{S}\right]}{\mathrm{d} t} & =k_{2} \tag{S4}
\end{array}\right\}
$$

Integration of eqs (S4) gives eqs (S5).

$$
\left.\begin{array}{l}
{\left[\mathrm{S}_{R}\right]=\left[\mathrm{S}_{R}\right]_{0}-k_{1} t}  \tag{S5}\\
{\left[\mathrm{~S}_{S}\right]=\left[\mathrm{S}_{S}\right]_{0}-k_{2} t}
\end{array}\right\}
$$

The combination of eqs (S5) leads to eq (S6).

$$
\begin{equation*}
\frac{k_{1}}{k_{2}}=\frac{\left[\mathrm{S}_{R}\right]_{0}-\left[\mathrm{S}_{R}\right]}{\left[\mathrm{S}_{S}\right]_{0}-\left[\mathrm{S}_{S}\right]} \tag{S6}
\end{equation*}
$$

For second order reaction, differential equation becomes as follows.

$$
\left.\begin{array}{l}
-\frac{\mathrm{d}\left[\mathrm{~S}_{R}\right]}{\mathrm{d} t}=k_{1}\left[\mathrm{~S}_{R}\right]^{2}  \tag{S7}\\
-\frac{\mathrm{d}\left[\mathrm{~S}_{S}\right]}{\mathrm{d} t}=k_{2}\left[\mathrm{~S}_{S}\right]^{2}
\end{array}\right\}
$$

Integration of eqs (S7) gives eqs (S8) and (S8’).

$$
\left.\begin{array}{l}
\left.\begin{array}{l}
k_{1} t=\frac{\left[\mathrm{S}_{R}\right]_{0}-\left[\mathrm{S}_{R}\right]}{\left[\mathrm{S}_{R}\right]\left[\mathrm{S}_{R}\right]_{0}} \\
k_{2} t=\frac{\left[\mathrm{S}_{S}\right]_{0}-\left[\mathrm{S}_{S}\right]}{\left[\mathrm{S}_{S}\right]\left[\mathrm{S}_{S}\right]_{0}}
\end{array}\right\} \\
{\left[\mathrm{S}_{R}\right]=\frac{\left[\mathrm{S}_{R}\right]_{0}}{\left[\mathrm{~S}_{R}\right]_{0} k_{1} t+1}} \\
{\left[\mathrm{~S}_{S}\right]=\frac{\left[\mathrm{S}_{S}\right]_{0}}{\left[\mathrm{~S}_{S}\right]_{0} k_{2} t+1}}
\end{array}\right\}
$$

The combination of eqs (S8) leads to eq (S9).

$$
\begin{equation*}
\frac{k_{1}}{k_{2}}=\frac{\left[\mathrm{S}_{S}\right]\left(\left[\mathrm{S}_{R}\right]_{0}-\left[\mathrm{S}_{R}\right]\right)}{\left[\mathrm{S}_{R}\right]\left(\left[\mathrm{S}_{S}\right]_{0}-\left[\mathrm{S}_{S}\right]\right)} \tag{S9}
\end{equation*}
$$

Following expressions are used for obtaining the equations.
$1-\mathrm{ee}_{\mathrm{s}}=\frac{2\left[\mathrm{~S}_{R}\right]}{\left[\mathrm{S}_{R}\right]+\left[\mathrm{S}_{S}\right]} \quad 1+\mathrm{ee}_{\mathrm{s}}=\frac{2\left[\mathrm{~S}_{S}\right]}{\left[\mathrm{S}_{R}\right]+\left[\mathrm{S}_{S}\right]}$
1- conv $=\frac{\left[\mathrm{S}_{R}\right]+\left[\mathrm{S}_{S}\right]}{\left[\mathrm{S}_{R}\right]_{0}+\left[\mathrm{S}_{S}\right]_{0}}$
$1-\mathrm{ee}_{\mathrm{p}}=\frac{2\left[\mathrm{P}_{S}\right]}{\left[\mathrm{P}_{R}\right]+\left[\mathrm{P}_{S}\right]} \quad 1+\mathrm{ee}_{\mathrm{p}}=\frac{2\left[\mathrm{P}_{R}\right]}{\left[\mathrm{P}_{R}\right]+\left[\mathrm{P}_{S}\right]} \quad$ convn $=\frac{\left[\mathrm{P}_{R}\right]+\left[\mathrm{P}_{S}\right]}{\left[\mathrm{S}_{R}\right]_{0}+\left[\mathrm{S}_{S}\right]_{0}}$

$$
\begin{equation*}
\left[\mathrm{S}_{R}\right]_{0}=\left[\mathrm{S}_{R}\right]+\left[\mathrm{P}_{R}\right] \quad\left[\mathrm{S}_{S}\right]_{0}=\left[\mathrm{S}_{S}\right]+\left[\mathrm{P}_{S}\right] \tag{S12}
\end{equation*}
$$
