

Supporting Information for
A Highly Selective Cascade Approach to Diverse Aromatic Ring
Systems from Simple Aromatic Aldehydes and Propiolates

I. General Considerations

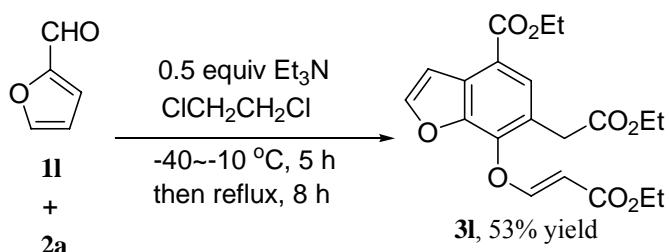

Column chromatography was carried out on silica gel (10-40 mesh) with mixed solvents (hexane-ethyl acetate). CH_2Cl_2 , $\text{ClCH}_2\text{CH}_2\text{Cl}$ and triethyl amine (TEA) were distilled from CaH_2 . Infrared spectra were obtained on a FTIR spectrometer. NMR spectra were recorded for ^1H NMR at 500 MHz otherwise noted, for ^{13}C NMR at 125 MHz at 293 K otherwise noted. Chemical shifts are reported relative to residue peaks of CDCl_3 (7.27 ppm for ^1H and 77.27 ppm for ^{13}C). The following abbreviations are used to describe peak patterns where appropriate: b = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet. Coupling constants are reported in Hertz (Hz). Low-resolution MS and HRMS were obtained using ESI ionization. Melting points were measured with micro melting point apparatus.

II. Procedures for the Reactions

General Procedure for Et₃N-catalyzed Cascade Approach to 3.

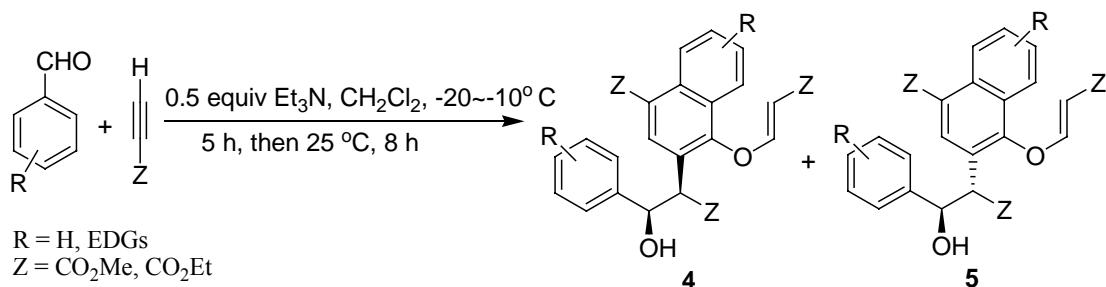

To a solution of benzaldehyde or 1-naphthaldehyde (2 mmol) and propiolate (3 mmol) in ClCH₂CH₂Cl (10 ml) was added dropwise TEA (1.5 mmol) in ClCH₂CH₂Cl (5 ml) under N₂ at -20°C during about 30 min. The mixture was stirred at -20 ~ -10 °C for 5 h and then refluxed for 8 h. After completion of the reaction, the mixture was washed with brine for two times and the organic layer was dried over anhydrous sodium sulfate. The solvent was removed and the residue was purified by column chromatography on silica gel with hexane-ethyl acetate (1:5 or 1:3) to afford the corresponding products **3**.

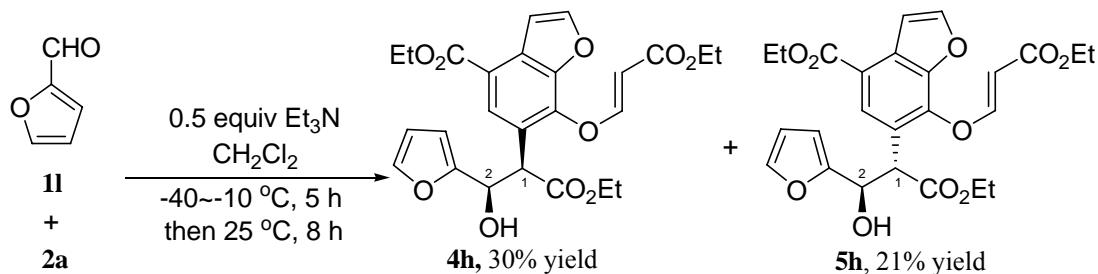

3l was obtained following the above-stated procedure only changing the temperature from -20 ~ -10 °C to -40 ~ -10 °C.

General Procedure for Et₃N-catalyzed Cascade Approach to 4 and 5.

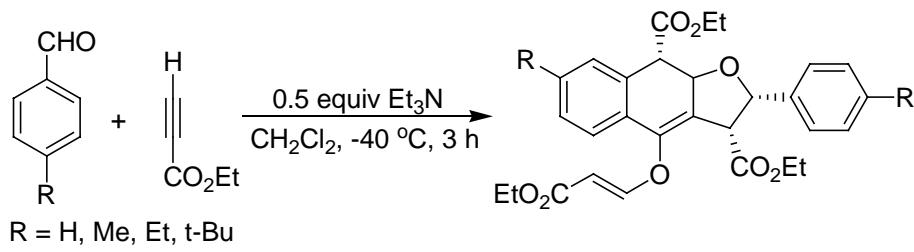

To a solution of benzaldehydes (2 mmol) and propiolates (3 mmol) in CH_2Cl_2 (10 ml) was added dropwise TEA (1.5 mmol) in CH_2Cl_2 (5 ml) for 30 min under N_2 at -20°C . The reaction mixture was stirred at $-20 \sim -10^\circ\text{C}$ for 5 h and then at 25°C for 8 h. The mixture was washed with brine for two times and the organic layer was dried over anhydrous sodium sulfate. The solvent was removed in vacuum and the residue was purified by column chromatography on silica gel with hexane-ethyl acetate (1:5 or 1:3) to give pure products **4** and **5**.

4h and **5h** were obtained following the above-stated procedure just changing the temperature from $-20 \sim -10^\circ\text{C}$ to $-40 \sim -10^\circ\text{C}$.

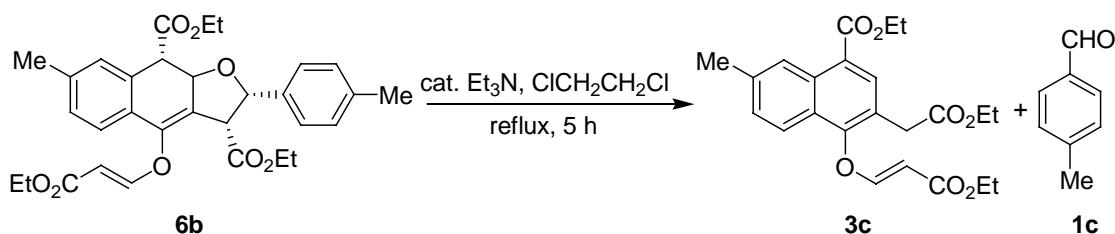

General Procedure for the Synthesis of 2,3,9,9a-tetrahydro-naphtho[2,3-b] furans **6**.

To a mixture of benzaldehyde (2 mmol) and ethyl propiolate (3 mmol) in CH_2Cl_2 (10 ml) was added dropwise TEA (1.5 mmol) in CH_2Cl_2 (5 ml) under N_2 at -40°C . The reaction

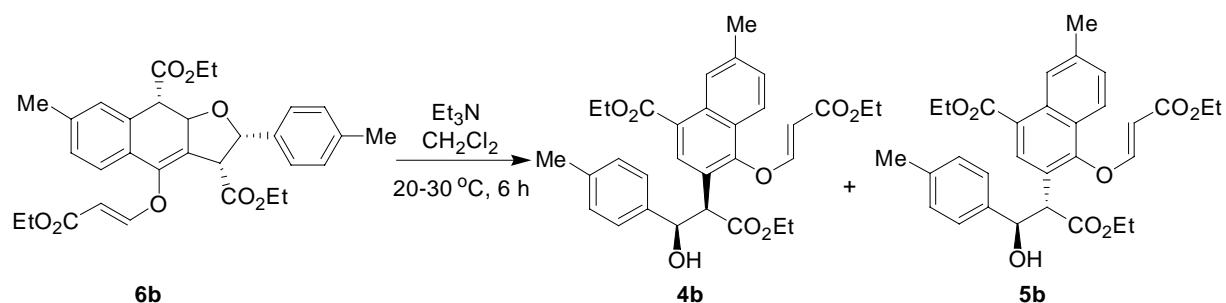

mixture was stirred at -40 °C for 3 h. Then 1N hydrochloric acid (1.5 ml) was added to quench the reaction. The solution was washed with brine, dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel with hexane-ethyl acetate (1:5) to afford pure compound **6**. The crystal of **6** was obtained from hexane.

Transformation of 6b to 3c.

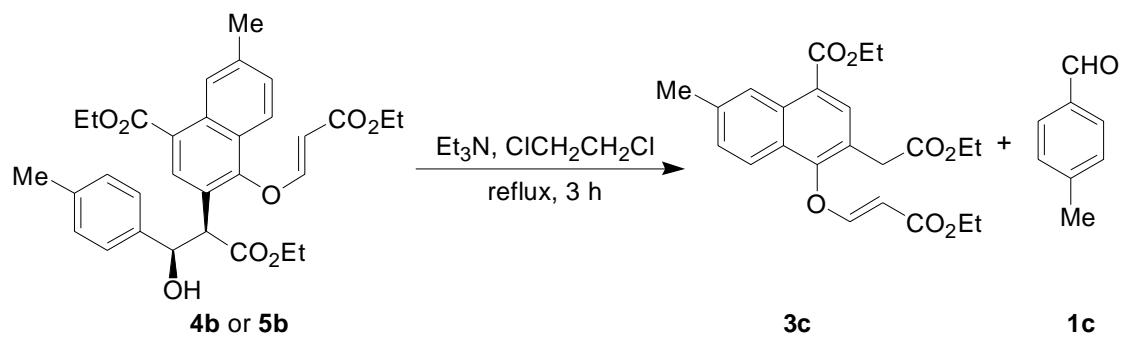

To a solution of **6b** (1 mmol) in $\text{ClCH}_2\text{CH}_2\text{Cl}$ (8 ml) was added three drops of TEA. The solution was refluxed for 5 h and then evaporated in vacuum. The residue was chromatographed on silica gel column with hexane-ethyl acetate (1:5) to give pure **3c** (90% yield) and **1c** (88% yield).

Transformation of 6b to 4b and 5b.

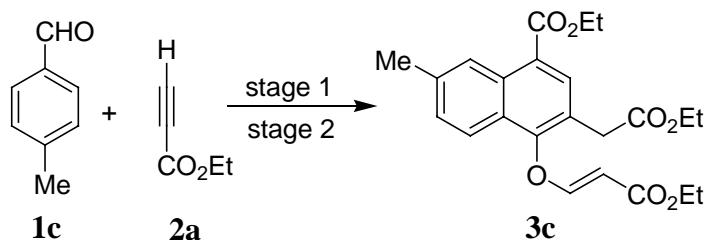

To a solution of **6b** (1 mmol) in CH₂Cl₂ (8 ml) was added three drops of TEA. The solution was stirred at 20-30 °C for 5 h and then concentrated in vacuum. The residue was chromatographed on silica gel column with hexane-ethyl acetate (1:5) to give pure products **4c** (33% yield) and **5c** (60% yield).

Transformation of 4b or 5b to 3c.

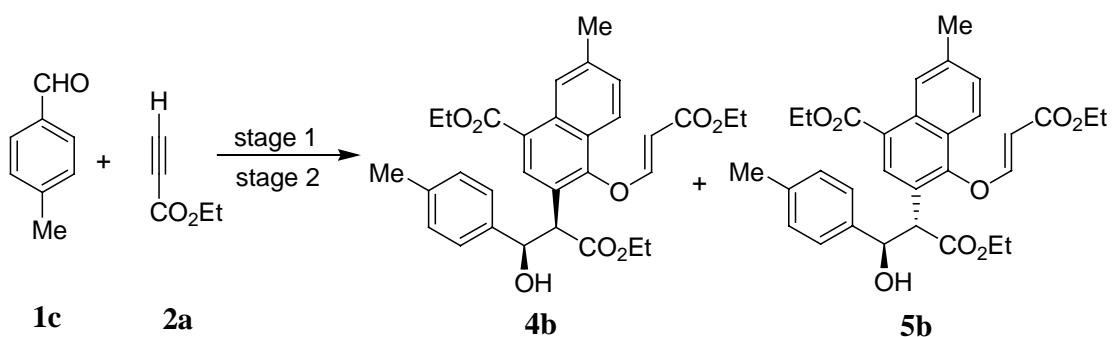

To a solution of **4b** or **5b** (1 mmol) in $\text{ClCH}_2\text{CH}_2\text{Cl}$ (15 ml) was added three drops of TEA. The solution was refluxed for 3 h and then concentrated in vacuum. The residue was purified by column chromatography on silica gel with hexane-ethyl acetate (1:5) to give **3c** in 95% yield, and **1c** in 90% yield.

III. Optimization of Reaction Conditions

entry	solvent	equiv of 2a	equiv of 1c	base / equiv	temperature($^{\circ}\text{C}$) / time (h)		yield ^a (%)
					Stage 1	Stage 2
