General Experimental Methods : Reagents and chemicals were purchased from commercial sources and used as received. All reactions requiring anhydrous conditions were performed under a positive pressure of argon in oven-dried glassware. All solvents were purified and distilled by standard methods. Thin layer chromatography (TLC) was performed on 0.25 mm E. Merck silica gel (60F-254) plates using UV light, $p$-anisaldehyde or ninhydrine. Column chromatography was carried out on Merck silica gel $60(40-63 \mu \mathrm{~m}) .{ }^{1} \mathrm{H}$ NMR spectra were recorded at 400 MHz , and ${ }^{13} \mathrm{C}$ NMR at 100 MHz with the sample solvent being $\mathrm{CDCl}_{3}$ unless otherwise noted (Bruker ARX 400). Chemical shifts are given in ppm, referenced to the residual proton resonances of the solvents. Coupling constants $(J)$ are given in Hertz $(\mathrm{Hz})$. The letters $\mathrm{m}, \mathrm{s}, \mathrm{d}, \mathrm{t}$, q mean respectively multiplet, singulet, doublet, triplet, quartet. The letters br mean the signal is broad. IR spectra were recorded on a Bruker Tensor 27 using ATR method. Elemental analysis were carried out by the "Service de microanalyse", ICSN CNRS, 91198 Gif sur Yvette, France or by the "Service de microanalyse", SIARE, 4 place Jussieu 75252 Paris cedex 05, France.

Compounds $7 \mathbf{a}^{1}$ and $\mathbf{8 a}{ }^{2}$ have been all ready described by us ( ${ }^{1}$ Commander, C.; Thorimbert, S.; Malacria, M. J. Org.
