GENERAL METHODS

Unless otherwise indicated, all ^1H and ^{13}C NMR spectra were recorded on a Varian Inova 400 MHz (400 MHz ^1H , 100 MHz ^{13}C) or Varian Inova 600 MHz (600 MHz ^1H , 150 MHz ^{13}C) at room temperature in CDCl_3 with internal CHCl_3 as the reference (7.27 ppm for ^1H and 77.23 ppm for ^{13}C). IR spectra were recorded on ASI ReactIR^R 1000 FT-IR spectrometer, equipped with a silicon probe. Peaks are reported (cm^{-1}) with the following relative intensities: s (strong, 67-100%), m (medium, 40-67%), w (weak, 20-40%) and br (broad). Melting points (mp) are uncorrected and were taken in open capillary tubes on a Thomas Hoover capillary melting point apparatus. *Since almost all of the Tp molybdenum complexes decompose at about 180-200 °C melting points are not significant and are not shown in the experimental section.* Optical rotations were measured with Perkin-Elmer 241MC or Perkin-Elmer Model 341 polarimeters. Analytical thin-layer chromatography (TLC) was carried out on commercial Baker-flex plastic-supported silica gel plates (thickness: 200 μm) with fluorescent indicator (F-254). Visualization was accomplished by UV light or stained with 5% phosphomolybdic acid (PMA) in ethanol. Flash column chromatography was performed with 32-63 μm silica gel. In some cases (as indicated) silica gel was first neutralized with Et_3N prior to chromatography. Dichloromethane (HPLC grade) and THF (99 %+) were purchased from EMD and Aldrich (respectively) and dried over 4 \AA molecular sieves before used. Dry diethyl ether was purchased from Mallinckrodt and used as received. Unless otherwise specified, all reactions were carried out under a nitrogen or argon atmosphere, and all reaction flasks were flamed or oven dried prior to use. The nomenclature for determining the chirality of the molybdenum complexes is straightforward.¹

STARTING MATERIALS.

All enones, TiCl_4 (1.0 M in dichloromethane), and NaOCH_3 (powder) were purchased from Aldrich; $t\text{-BuOK}$, and KOSiMe_3 were purchased from Fluka. All chemicals were used as received. (\pm)-Dicarbonyl[hydridotris(1-pyrazolyl)borato][(η^3 -2,3,4)-5-oxo-5,6-dihydro-2*H*-pyran-2-

GENERAL PROCEDURE FOR MUKAIYAMA-MICHAEL ADDITIONS.⁵

To a CH_2Cl_2 solution of the molybdenum complexes **1** and **2** (1.0 equiv) was successively added Et_3N (1.10-1.15 equiv) and *t*-BuMe₂SiOSO₂CF₃ (TBSOTf, 1.10 equiv). The reaction mixture was stirred at room temperature for about 10 min and was then cooled to -78°C . To this cold solution was rapidly added a premixed CH_2Cl_2 solution of the indicated enones (1.4 equiv) and titanium tetrachloride (1.3 equiv) via syringe. The indicated enones were first dissolved in CH_2Cl_2 and then cooled to -78°C . To this cold solution was then added titanium tetrachloride (1.0 M

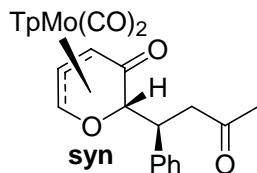

solution in CH₂Cl₂) via syringe. The reaction mixture was stirred at the indicated temperature for the indicated time, quenched with 1 mL of water or saturated sodium bicarbonate aqueous solution at -78 °C, and then partitioned between brine and dichloromethane. The organic layer was separated, and the aqueous layer was extracted with dichloromethane. The organic layers were combined, dried with Na₂SO₄ and the solvent was removed under vacuum to afford crude products. The crude products were purified by column chromatography to give solid organic products. The ratio of isomers was determined by ¹H NMR of the crude product. (Note: the reaction yields depended significantly on the quality of titanium tetrachloride.)

(±)-Dicarbonyl[hydridotris(1-pyrazolyl)borato][(2S,6S)-(η³-2,3,4)-5-oxo-6-(3-oxobutyl)-5,6-dihydro-2H-pyran-2-yl]molybdenum, (±)-3.

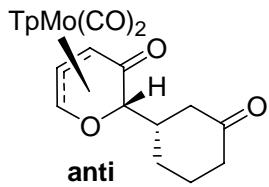

Following the general procedure, to a 10 mL CH₂Cl₂ solution of the molybdenum complex **1** (0.92 g, 2.0 mmol) was successively added Et₃N (307 μL, 2.2 mmol) and TBSOTf (506 μL, 2.2 mmol). The reaction mixture was stirred at room temperature for about 10 min and was then cooled to -78 °C. To this cold solution was rapidly added a premixed 10 mL CH₂Cl₂ solution of methyl vinyl ketone MVK (196 mg, 2.8 mmol) and titanium tetrachloride (2.6 mL, 2.6 mmol) via syringe. The reaction mixture was stirred at -78 °C for 5 min and quenched with 1 mL of saturated sodium bicarbonate aqueous solution at -78 °C. After work-up the crude product was purified by flash chromatography (1:1 hexanes-EtOAc) to give **3** as an orange solid (1.00 g, 94%). **(±)-3:** TLC (R_f = 0.43, 1:1 hexanes-EtOAc). Following the general procedure, to a 5 mL CH₂Cl₂ solution of the molybdenum complex **1** (500 mg, 1.09 mmol) was successively added Et₃N (174 μ L, 1.25 mmol) and TBSOTf (275 μ L, 1.20 mmol). The reaction mixture was stirred at room temperature for about 10 min and was then cooled to -78 °C. To this cold solution was rapidly added a premixed 5 mL CH₂Cl₂ solution of *trans*-4-phenyl-3-buten-2-one (204 mg, 1.53 mmol) and titanium tetrachloride (1.42 mL, 1.42 mmol) via syringe. The reaction mixture was stirred at -78 °C for 20 min and quenched with 1 mL of saturated sodium bicarbonate aqueous solution at -78 °C. After work-up the ¹H NMR spectrum of the crude product (582 mg) showed a mixture of the two diastereomers (*anti:syn* = 1:10) of **4** and the starting material **1** as well. Although **4** could not be separated from **1** the yield (71%) was estimated by the ¹H NMR spectrum of the crude product. GENERAL PROCEDURE FOR METAL-MEDIATED 1,5-MICHAEL-TYPE ADDITIONS.

To a CH_2Cl_2 solution of the molybdenum complex **3-7** (1.0 equiv) was added the indicated amount of base (3.0-6.0 equiv). The reaction mixture was stirred at room temperature until TLC monitoring of the reaction mixture indicated the disappearance of the starting material. The indicated amount of Meerwein salt Me_3OBF_4 (2.5-5.0 equiv) was added as a solid, and the mixture was then stirred at room temperature for the indicated time. The reaction mixture was directly poured onto a short pad of silica gel. Elution with 50% ethyl acetate in hexanes, concentration and careful chromatographic purification afforded products **8-15** as yellow solids. Unless the isomers could be separated by flash column chromatography, the ratio of isomers was determined by ^1H NMR of the crude product.

Purification by flash chromatography afforded the molybdenum complexes (\pm)-**12-exo** (97 mg, 95%) and (\pm)-**12-endo** (2 mg, 2%). The diastereoselectivity is strongly related to the trapping time with the Meerwein salt. HPLC analysis of the reaction mixture indicated an *exo* / *endo* ratio of 17:1 in 4 h after addition of Meerwein salts. Prolongation of the reaction time to 15 h resulted in an *exo* / *endo* ratio of 5:1.

DETERMINATION OF ENANTIOMERIC EXCESSES BY HPLC

HPLC was performed on an Agilent 1100 Series HPLC chromatograph with ZORBAX Eclipse XDB-C8 (4.6 \times 150 mm, 5 μ m), CHIRALPAK AS-RH, CHIRALPAK OD-RH and CHIRALPAK AD-RH columns at room temperature using a Diode Array Detector (DAD) with multiple wavelengths (210 nm, 230 nm, 254 nm, and 280 nm). Samples of products for HPLC analyses were prepared by dissolving several milligrams of pure compound in 2-3 mL of CH_3CN .

One microliter (1 μ L) of the solution was injected for the HPLC analysis. HPLC grade acetonitrile (or acetonitrile containing 0.1% of trifluoroacetic acid) and water were used. Racemic samples were run first to find both enantiomers. The results are listed in Table S1.

^a CHIRALPAK AS-RH, CHIRALPAK AD-RH. ^b Gradient eluent except for **16**: 40 % of CH₃CN in H₂O (3 min), 65 % of CH₃CN in H₂O (7.5 min), 99 % of CH₃CN in H₂O (9 min); for **16**, 30 % of CH₃CN, 70% of CH₃CN containing 0.1% of CF₃COOH. Flowrate 1 mL/min. DAD detector $\lambda = 254$ nm. ^c in minutes.

X-RAY CRYSTALLOGRAPHIC STUDIES.

Crystals of (\pm)-**13** were obtained by recrystallization from dichloromethane and hexanes. A suitable single crystal was coated with Paratone N oil, suspended in a small fiber loop and placed in a cooled nitrogen gas stream at 173 K on a Bruker D8 SMART APEX CCD sealed tube diffractometer with graphite monochromated MoK _{α} (0.71073 \AA) radiation. Data were measured using a series of combinations of phi and omega scans with 10 s frame exposures and 0.3° frame widths. Data collection, indexing and initial cell refinements were all carried out using SMART⁶ software. Frame integration and final cell refinements were done using SAINT⁷ software. The final cell parameters were determined from least-squares refinement on 5054 reflections. The SADABS⁸ program was used to carry out absorption corrections.

The structure was solved using Direct methods and difference Fourier techniques (SHELXTL, V6.12).⁹ Hydrogen atoms were placed their expected chemical positions using the HFIX command and were included in the final cycles of least squares with isotropic U_{ij} 's related to the atom's ridden upon. The C-H distances were fixed at 0.93 \AA (aromatic and amide), 0.98 \AA (methine), 0.97 \AA (methylene), or 0.96 \AA (methyl). All non-hydrogen atoms were refined anisotropically. Scattering factors and anomalous dispersion corrections are taken from the

*International Tables for X-ray Crystallography.*¹⁰ Structure solution, refinement, graphics and generation of publication materials were performed by using SHELXTL, V6.12 software. Additional details of data collection and structure refinement are given in Table S2.
