S9-S32 ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ Spectra of $\mathbf{2}, \mathbf{4 - 6}, \mathbf{8}-\mathbf{1 4}$ in $\mathrm{CDCl}_{3}$ and of $\mathbf{1 5}$ in $\mathrm{D}_{2} \mathrm{O}$

General - ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ (internal standard $\mathrm{CHCl}_{3}$ at $\delta 7.26$ ) or $\mathrm{D}_{2} \mathrm{O}$. Assignment of proton chemical shifts were based on decoupling experiments. Analytical thin layer chromatography (TLC) were performed on aluminium plates precoated with Silica Gel $60 \mathrm{~F}_{254}$ as the adsorbent. Column chromatography was performed on Kieselgel 60 (63-200 mesh). Mass spectra were recorded in a reflection positive mode on a MALDI-TOF spectrometer. Acid washed molecular sieves and Ytterbium(III) triflate were dried by overnight heating at $200^{\circ} \mathrm{C}$ under vacuum before their use in glycosidations.

## Preparation of $5 \AA$ acid washed molecular sieves

Commercial $5 \AA$ molecular sieves (UOP Type $5 \AA, 1 / 8^{\prime \prime}$ rods, purchased from Fluka) were treated three times with a saturated aqueous solution of ammonium chloride for 20 minutes. The sieves were then repeatedly washed with distilled water until neutralization of the washing liquid. The sieves were left to dry at room temperature and then were heated at $200^{\circ} \mathrm{C}$ under vacuum for 5 hours. The latter procedure was repeated until no further generation of moisture was observed from the sieves upon this treatment.

## Synthesis of donor 4

2-azido-3,4,6-tri- $O$-acetyglucopyranose ${ }^{1}(417 \mathrm{mg}, 1.3 \mathrm{mmol})$ was dissolved in anhydrous dichloromethane ( 3 mL ). To this solution N-phenyl trifluoroacetimidoyl chloride ${ }^{2}(250 \mu \mathrm{~L}, 2 \mathrm{mmol})$ and sodium hydride ( $60 \%$ suspension in oil, $69 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) were added at $0^{\circ} \mathrm{C}$. After three hours the mixture was concentrated under vacuum and the residue chromatographed on a silica gel column eluted with petroleum ether/ethyl acetate $4: 1$ (with a few drops of triethylamine) to afford the imidate 4 ( $496 \mathrm{mg}, 76 \%$ yield) as an oil.

## Synthesis of $\mathbf{7}^{3}$

Triethylsilane ( $1.6 \mathrm{~mL}, 10 \mathrm{mmol}$ ) was added to a solution of commercially available penta- $O$-acetyl $-\beta$-galactose ( 3.00 g , 7.7 mmol ) and iodine ( $2.540 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) in anhydrous dichloromethane ( 15 mL ). The mixture was refluxed for 20-30 minutes (the quantitative obtention of the UV visibile glycosyl iodide can be monitored by TLC analysis), and then cooled to $0^{\circ} \mathrm{C}$. Lutidine ( $3.0 \mathrm{~mL}, 31.0 \mathrm{mmol}$ ), ethanol ( $2.2 \mathrm{~mL}, 46.2$ mmol ), and TBAB ( $845 \mathrm{mg}, 2.6 \mathrm{mmol}$ ) were sequentially added at $0^{\circ} \mathrm{C}$
and the mixture was allowed to warm to room temperature. After stirring overnight, the mixture was concentrated under vacuum and the crude product suspended in anhydrous toluene ( 12.5 mL ). After the addition of $\mathrm{KOH}(10.3 \mathrm{~g}, 0.183 \mathrm{~mol})$, the mixture was heated up to reflux and benzyl bromide ( $10.0 \mathrm{~mL}, 77.4 \mathrm{mmol}$ ) was added. After two hours the organic phase was washed with water until neutrality and the collected aqueous phases extracted with dichloromethane. The collected organic phases were then dried and concentrated under vacuum. The residue was purified by a silica gel chromatography (eluent petroleum ether/ethyl acetate 9:1 with a few drops of triethyl amine) to yield orthoester 7 as an oil (2.246 $\mathrm{g}, 56 \%$ overall yield from peracetylated galactose).

## Synthesis of 10

$\mathrm{PdCl}_{2}(51 \mathrm{mg}, 0.28 \mathrm{mmol})$ was added to a solution of $9(759 \mathrm{mg}, 1.4$ mmol ) in non anhydrous methanol ( 10 mL ). After stirring for 5 hours at room temperature the mixture was concentrated and the residue filtrated on a short silica gel plug (eluent dichloromethane/methanol 95:5) to remove the palladium byproducts. The filtrated was concentrated to yield crude $\mathbf{1 0}(715 \mathrm{mg})$ in a satisfying purity to be directly used in the following step.

## Synthesis of disaccharide 11

Donor 4 ( $246 \mathrm{mg}, 0.49 \mathrm{mmol}$ ) and acceptor $\mathbf{3}^{5}$ (194 $\mathrm{mg}, 0.35 \mathrm{mmol}$ ) were coevaporated three times with anhydrous toluene and kept for an our hour under vacuum. After the addition of freshly activated $4 \AA$ AW 300 MS (ca 400 mg in pellets), the mixture was dissolved under argon in anhydrous acetonitrile ( 1.8 mL ) at $0^{\circ} \mathrm{C}$. After 15 minutes a solution of $\mathrm{Yb}(\mathrm{OTf})_{3}(21.7 \mathrm{mg}, 0.035 \mathrm{mmol})$ in acetonitrile $(1.1 \mathrm{~mL})$ was added. The mixture was allowed to warm to room temperature and left overnight under stirring to ensure complete glycosidation. The reaction was quenched with a few drops of pyridine and the mixture filtered on a short plug of silica gel eluted with 9:1 dichloromethane/methanol (with a few drops of pyridine). The residue was then chromatographed on a silica gel column eluted with petroleum ether/ethyl acetate (from 8:2 to 7:3) to yield pure disaccharide 11 ( $211 \mathrm{mg}, 70 \%$ ).

## Synthesis of 12

Disaccharide 11 ( $199 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) was dissolved in $\mathrm{MeOH}(9.8 \mathrm{~mL})$. Ammonium hydroxide ( $32 \%$ aqueous solution, 1.1 mL ) was then added and the mixture was left under stirring at room temperature. After 3 hours the mixture was concentrated under vacuum and the residue
coevaporated with anhydrous toluene. The crude triol was then dissolved in anhydrous acetonitrile ( 4 mL ), and benzaldehyde dimethyl acetal ( $60 \mu \mathrm{~L}, 0.40 \mathrm{mmol}$ ) and camphorsulfonic acid ( $6 \mathrm{mg}, 0.026 \mathrm{mmol}$ ) were added. The mixture was kept for 3 hours at $70^{\circ} \mathrm{C}$ and then diluted with ethyl acetate. The organic phase was washed with saturated aq bicarbonate. The residue from the organic phase was chromatographed on a silica gel column (eluent dichloromethane and 98:2 dichloromethane/methanol) to give pure compund 12 (152 $\mathrm{mg}, 80 \%$ ) as an oil.

## Synthesis of 13

A solution of donor $5(86 \mathrm{mg}, 0.12$ mmol ) in 5:1 dichloroethane/cyclohexane $(720 \mu \mathrm{~L})$ was added in 6 hours at room temperature by a syringe pump to a solution of acceptor $12(53 \mathrm{mg}, 0.063$ mmol ) in 5:1 dichloroethane/cyclohexane $(1.2 \mathrm{~mL})$ containing freshly activated $5 \AA$ AW molecular sieves in pellets ( 1.1 g ). After completion of the addition the mixture was left under overnight stirring to ensure complete consumption of the donor. The mixture was then filtered on a cotton plug washed repeatedly with 9:1 dichloromethane/methanol (with drops of pyridine). Silica gel chromatography of the residue from the organic phase (eluent: petroleum ether/ethyl acetate from 8:2 to $65: 35)$ afforded pure trisaccharide $\mathbf{1 3}(63 \mathrm{mg}, 75 \%)$ as an oil.

## Synthesis of 2

Trisaccharide 14 ( $69 \mathrm{mg}, 0.055 \mathrm{mmol}$ ) and the fucosyl donor $6(99 \mathrm{mg}, 0.16$ mmol ) were coevaporated three times in anhydrous toluene. After adding $4 \AA$ AW 300 MS, the mixture was dissolved under argon in 4:1 dichloromethane/diethyl ether $(1.5 \mathrm{~mL})$ and immediately cooled to $-30{ }^{\circ} \mathrm{C}$. After stirring for 15 minutes, a solution of ytterbium triflate ( $3.4 \mathrm{mg}, 5.5 \mu \mathrm{~mol}$ ) in dioxane $(300 \mu \mathrm{~L})$ was added dropwise. After three hours at $-30^{\circ} \mathrm{C}$ the mixture was allowed to warm to room temperature to ensure the consumption of residual amounts of the donor and the reaction was then quenched with pyridine. The mixture was filtered on a short plug of silica gel washed with 9:1 dichloromethane/methanol (with drops of pyridine). The residue was then purified on a silica gel column eluted with toluene/ethyl acetate (from 5:1 to 3:1) to yield tetrasaccharide 2 (61 $\mathrm{mg}, 66 \%$ ) as the only detectable anomer.
