## Supporting Information

Materials and General Methods. Small-scale ( $<100 \mathrm{mg}$ ) arylation reactions were carried out in capped glass vials (VWR, 8 mL ) equipped with a Teflon-coated septum, heated in a 34-well reaction block (Chemglass). Large-scale ( $>1 \mathrm{~g}$ ) arylation reactions were performed in resalable pressure tubes equipped with a Teflon cap and glass plunger (Ace glass), heated in an oil bath. NMR spectra were obtained on a Bruker spectrometer operating at 400 MHz or 300 MHz for ${ }^{1} \mathrm{H}$ NMR, 100 MHz or 75 MHz for ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR and 121 MHz for ${ }^{31} \mathrm{P}$ NMR in $\mathrm{CDCl}_{3}$ unless otherwise noted. IR spectra were obtained on a Bomen MB-100 FT IR spectrometer. Gas chromatography was performed on an Agilent Technologies 6890 N gas chromatograph equipped with a 25 m polydimethylsiloxane capillary column and 5973 Mass Selective Detector. Flash column chromatography was performed employing 200-400 mesh silica gel (EM). Thin layer chromatography (TLC) was performed on silica gel $60 \mathrm{~F}_{254}$ eluting with a 5:1 mixture of hexanes and ethyl acetate unless noted otherwise. $\left[4-\left(\mathrm{CF}_{3}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right]_{3} \mathrm{P} \quad(\mathbf{L})^{1}$ and $\left[\mathrm{Rh}(\mathrm{coe})_{2} \mathrm{Cl}\right]_{2}(\mathbf{1})^{2}$ were synthesized employing known procedures and were as effective as those obtained commercially from Strem. CsOPiv, ${ }^{3}$ 1-indole- $d_{l},{ }^{4}$ 2-indole- $d_{l}{ }^{5}$ and 3-indole- $d_{l}{ }^{5}$ were synthesized employing known procedures. 1,4-dioxane (Anhydrous, Aldrich), haloarenes (Aldrich) and all other reagents were obtained commercially and used as received.

## Arylation of Indoles and Pyrroles: Representative Procedures

Small scale: In an argon-filled glovebox, indole ( $29.3 \mathrm{mg}, 0.25 \mathrm{mmol}$ ), $1(4.5 \mathrm{mg}$, $6.3 \mu \mathrm{~mol})$, $\left[4-\left(\mathrm{CF}_{3}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right]_{3} \mathrm{P}(\mathbf{L}, 18.0 \mathrm{mg}, 39 \mu \mathrm{~mol})$, CsOPiv ( $82.0 \mathrm{mg}, 0.35 \mathrm{mmol}$ ) and $\mathrm{PhI}(61.0 \mathrm{mg}, 0.30 \mathrm{mmol})$ were charged into a vial, followed by the addition of $1,4-$ dioxane ( 0.2 mL ). The vial was capped, brought out the glovebox, and heated at $120{ }^{\circ} \mathrm{C}$ in a reaction block for 24 h . The reaction mixture was cooled to room temperature, and passed through a short plug of silica gel ( $3 \mathrm{~cm} \times 0.5 \mathrm{~cm}, \mathrm{~L} \times \mathrm{ID}$ ), eluting with EtOAc (10 mL ). The resulting solution was concentrated, dry loaded to a column, and flash chromatographed ( $15: 1$, hexanes:EtOAc) to give 2-phenyl indole ( $39.6 \mathrm{mg}, 82 \%$ ) as a white powder.

Small scale (Reagents weighed in air): On benchtop, $1(4.5 \mathrm{mg}, 6.3 \mu \mathrm{~mol})$, [4$\left.\left(\mathrm{CF}_{3}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right]_{3} \mathrm{P}(\mathbf{L}, 18.0 \mathrm{mg}, 39 \mu \mathrm{~mol})$, CsOPiv ( $82.0 \mathrm{mg}, 0.35 \mathrm{mmol}$ ), 5-bromoindole ( $49.0 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) and 4-iodoanisole ( $70.2 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) were rapidly charged into a vial. The vial was subsequently capped, evacuated with a needle through the septum, refilled with argon, and 1,4-dioxane ( 0.2 mL ) was then added via a syringe through the septum. The vial was then heated at $120{ }^{\circ} \mathrm{C}$ in a reaction block for 24 h . The reaction mixture was cooled to room temperature, and passed through a short plug of silica gel $(3 \mathrm{~cm} \times 0.5 \mathrm{~cm}, \mathrm{~L} \times \mathrm{ID})$, eluting with $\mathrm{EtOAc}(10 \mathrm{~mL})$. The resulting solution was concentrated, dry loaded to a column, and flash chromatographed $(8: 1 \rightarrow 5: 1$, hexanes:EtOAc) to give 5-bromo-2-(4-methoxyphenyl) indole ( $53.5 \mathrm{mg}, 72 \%$ ) as a pale yellow solid.

Gram scale: On bench top, a mixture of indole ( $1.17 \mathrm{~g}, 10.0 \mathrm{mmol}$ ), $\mathbf{1}(71.7 \mathrm{mg}, 0.10$ $\mathrm{mmol})$, $\left[4-\left(\mathrm{CF}_{3}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right]_{3} \mathrm{P}(279 \mathrm{mg}, 0.30 \mathrm{mmol})$, CsOPiv ( $3.26 \mathrm{~g}, 14.0 \mathrm{mmol}$ ) and PhI $(2.45 \mathrm{~g}, 12.0 \mathrm{mmol})$ were charged into into a 20 mL threaded pressure tube (Ace glass). The tube was then capped, evacuated, refilled with argon, and 1,4-dioxane ( 8 mL ) was added under a flow of argon. The tube was purged with argon for 2 min , capped and heated at $120{ }^{\circ} \mathrm{C}$ with vigorous stirring. After 52 h , the reaction mixture were cooled to room temperature and filtered through a plug of silica gel ( $4 \mathrm{~cm} \times 5 \mathrm{~cm}, \mathrm{~L} \times \mathrm{ID}$ ), eluting with EtOAc ( 30 mL ). The resulting solution was concentrated to give a dark colored solid.

This solid was then washed with hexanes/ether ( $50: 1,10 \mathrm{~mL} \times 3$ ) afforded 2-phenyl indole $(1.45 \mathrm{~g}, 75 \%)$ as a tan powder ( $>98 \%$ pure by GC-MS).

The resulting yellowish mixture was then cooled to room temperature, and diluted with hexanes ( 15 ml ). The yellow precipitation was collected on a frit, sequentially washed (hexanes $/ 10 \mathrm{~mL} \times 2$, $\mathrm{H}_{2} \mathrm{O} / 10 \mathrm{~mL} \times 3$, hexanes $/ 10 \mathrm{~mL} \times 2$ ) and then dried on high vacuum for 60 min to give 2 $(585 \mathrm{mg}, 89 \%)$ as a fine yellowish powder. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ 6.72-8.30 (broad s, 24 H ), $6.63(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.51(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.34(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2$ H), $0.32(\mathrm{~s}, 18 \mathrm{H}) .{ }^{31} \mathrm{P}$ NMR ( 121 MHz, Dioxane- $d_{8}$ ): $\delta 25.2\left(\mathrm{~d}, J_{\mathrm{Rh}-\mathrm{P}}=113 \mathrm{~Hz}\right.$ ). The vial was capped with a Teflon septum-equipped cap, heated at $120^{\circ} \mathrm{C}$ for 3 minutes and the reaction was then monitored by GC-MS.

The vial was capped with a Teflon septum-equipped cap, heated at $120^{\circ} \mathrm{C}$ for 3 minutes and the reaction was then monitored by GC-MS.

For reaction 3: A reaction vial was charged with $2(16.4 \mathrm{mg}, 12.5 \mu \mathrm{~mol})$, stock $\mathbf{A}$ $(250 \mu \mathrm{~L}), 4$-TolI $(100 \mu \mathrm{~L}, 1.25 \mathrm{M})$ and dioxane $(150 \mu \mathrm{~L})$. The vial was capped with a Teflon septum-equipped cap, heated at $120^{\circ} \mathrm{C}$ for 3 minutes and the reaction was then monitored by GC-MS. ## Kinetics of Catalytic Reactions ${ }^{4}$

Measurement of H/D kinetic isotope effect: In an argon filled glovebox, 1 (9.0 $\mathrm{mg}, 0.0125 \mathrm{mmol}), \mathrm{P}\left[4-\left(\mathrm{CF}_{3}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right]_{3}(\mathrm{~L}, 36.0 \mathrm{mg}, 0.075 \mathrm{mmol})$, indole $(58.5 \mathrm{mg}, 0.50$ mmol ), benzophenone (internal standard, 29 mg ), CsOPiv ( $164 \mathrm{mg}, 0.70 \mathrm{mmol}$ ) and PhI ( $122 \mathrm{mg}, 0.60 \mathrm{mmol}$ ) was charged into a vial, followed by the addition of 1,4-dioxane $(1.0 \mathrm{~mL})$. Similarly, reaction mixture were loaded into three other vials with 1 -indole- $d_{1}$ ( $59.0 \mathrm{mg}, 0.50 \mathrm{mmol}$ ), 2-indole- $d_{l}(59.0 \mathrm{mg}, 0.50 \mathrm{mmol})$ and 3-indole- $d_{l}(59.0 \mathrm{mg}, 0.50$ mmol ), respectively. The vials were capped, brought out the glovebox, and heated at 120 ${ }^{\circ} \mathrm{C}$ in a reaction block. After 5 minutes of preheating, reaction samples were taken periodically via syringe and their component concentration was analyzed via a GC/FID. H/D scrambling of indole was checked via GC/MS detector separately. Data are plotted in Figure S10. Initial rates are plotted in Figure S11.

Figure S10. Initial conditions: $[\mathbf{1}]=12.5 \mu \mathrm{M},[\mathbf{L}]=37.5 \mu \mathrm{M}$, [Indole $]=0.50 \mathrm{M},[\mathrm{PhI}]=$ 0.60 M .

Figure S11
D/H scrambling was monitored by GC/MS separately. 1-indole- $d_{l}$ lost $\sim 20 \%$ deuterium after $200 \mathrm{~min}, 2$-indole $-d_{l}$ lost $<5 \%$ deuterium after 200 min , 3-indole- $d_{l}$ lost $\sim 30 \%$ deuterium in 200 minutes. Partial loss of deuterium from 1-indole- $d_{1}$ and 3-indole- $d_{1}$ does not cause significant deviation in KIE measurement, as KIE at both positions are close to $1\left(k_{\mathrm{D}} \approx k_{\mathrm{H}}\right)$.

[^0]:    ${ }^{1} 1$ equivalence of phosphine $\mathbf{L}$ was added to maintain the concentration of free phosphine.
    ${ }^{2}$ Formation of 2-(4-Tolyl) indole was also observed after 30 minutes via the generation of complex 3 .

[^1]:    ${ }^{3}$ Due to the decomposition of $\mathbf{2}$ in the absence of CsOPiv and PhI (trapping effect), reaction order for the stoichiometric reaction of $\mathbf{2}$ and indole was determined using initial rate kinetics.

[^2]:    ${ }^{4}$ Due to the gradual decomposition of phosphine (erosion) during reaction process, direct measurements of $\mathrm{k}_{\mathrm{H}}$ and $\mathrm{k}_{\mathrm{D}}$ from individual reactions were not feasible. Initial rate kinetics were applied instead.
