## SUPPORTING INFORMATION

#### Abstract

Representative experimental procedures, spectral data, and ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra for all the acylation products are included (148 pages).

General. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in deuterochloroform with chloroform as an internal reference unless otherwise stated. Chemical shifts are reported in ppm ( $\delta$ ). Coupling constants, $J$, are reported in Hz. Infrared spectra were reported with peaks in units of $\mathrm{cm}^{-1}$ with the following relative intensities: br (broad), s (strong 67-100 \%), m (medium 33-67 \%), or w (weak 0-33 \%). Mass spectra were recorded with an ionization voltage of 70 or 20 eV unless otherwise stated. Combustion analyses were performed by the Northern Instrument Center of Taiwan. Fast atom bombardment (FAB) and electrospray (ESI) mass spectra were reported with data in the form $\mathrm{m} / \mathrm{e}$ (intensity relative to base peak). Gel permeation chromatography (GPC) data were obtained by using THF as eluting solvent at room temperature and a polystyrene calibration curve for analyses. Analytical TLC was visualized with UV light or with phosphomolybdic acid (PMA) and $\mathrm{KMnO}_{4}$ staining agents. Column (flash) chromatography was performed using 32-63 $\mu \mathrm{m}$ silica gel. Solvents for extraction and chromatography were reagent grade. Dichloromethane was dried over $\mathrm{CaH}_{2}$ before use. THF was dried over Na with benzophenone-ketyl intermediate as indicator. All reactions were run under nitrogen and the acylation products were isolated as chromatographically pure materials. The $\mathrm{VOX}_{2}$ series of compounds (brand name as Clip-all ${ }^{\circledR}$ series, US patent \# $6,541,659$ B1, 2003) is now available directly from the institution (e-mail: chefv043@ scc.ntnu.edu.tw).

## General procedure for acylation reactions

In a dry $50-\mathrm{mL}$, two-necked, round-bottomed flask was placed $\mathrm{MoO}_{2} \mathrm{Cl}_{2}(1.9 \mathrm{mg}, 0.01 \mathrm{mmol})$ in 3 mL of anhydrous solvent $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ was used unless it is stated otherwise). To the above solution, anhydride ( 1.5 mmol ) was slowly added at ambient temperature. After for 30 min , a solution of nucleophile ( 1.0 mmol in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 2 \mathrm{~mL}$ ) was slowly added to the above bluish solution and the reaction mixture was stirred for indicated time periods. After completion of the reaction as monitored by TLC, the reaction mixture was quenched with cold, saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 5 mL ). For the acylation of $\beta$-hydroxy ketones or esters, ice-cold water was used to quench the reaction to prevent $\beta$-elimination. The separated organic layer was washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and evaporated. The crude product was purified by column chromatography on silica gel if required (in most of the acetylation reactions, essentially pure material was obtained without further purification). The product obtained was characterized by routine spectroscopic methods.

## General procedure for catalyst recovery

In a dry $250-\mathrm{mL}$, two-necked, round-bottomed flask was placed $\mathrm{MoO}_{2} \mathrm{Cl}_{2}$ ( $100 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in 50 mL of anhydrous solvent $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ was used unless it is stated otherwise). To the above solution, anhydride ( 75 mmol ) was slowly added at ambient temperature. After for 30 min , a solution of nucleophile ( 50 mmol in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 20 \mathrm{~mL}$ ) was slowly added to the above bluish solution and the reaction mixture was stirred for indicated time periods. After completion of the reaction as monitored by TLC, the reaction mixture was quenched with ice-cold water ( 100 mL ). The separated aqueous layer was concentrated by rotatory evaporator at $40^{\circ} \mathrm{C}$. Subsequently, the recovered catalyst was dried in vacuo at ambient temperature for 2 hours to get bluish solid (100 mg ) in essentially quantitative recovery.

## Phthalic acid monophenethyl ester and diphenethyl ester

In a dry $50-\mathrm{mL}$, two-necked, round-bottomed flask was placed $\mathrm{MoO}_{2} \mathrm{Cl}_{2}(4 \mathrm{mg}, 0.02 \mathrm{mmol})$ in 20 mL of anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. To the above solution, phthalic anhydride ( $444.3 \mathrm{mg}, 3.0 \mathrm{mmol}$ ) was added at ambient temperature and stirred for one hour. The reaction flask was cooled to $10{ }^{\circ} \mathrm{C}$. A solution of 2-phenylethanol ( $239 \mu \mathrm{~L}, 2.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was slowly added to the above dark green solution. The resultant reaction mixture was stirred at this temperature for 78 hours. After completion of the reaction as monitored by TLC, the reaction mixture was quenched with $1 \mathrm{~N} \mathrm{HCl}(10 \mathrm{~mL})$ and stirred for one hour. The separated organic layer was washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and evaporated. The crude product was purified by column chromatography on silica gel (EtOAc/hexane, 1/5) to give the mono-phenethyl ester in $92 \%$ (497 mg ) along with di-phenethyl ester ( $<1 \%$ ).

## General procedure for acylation of tert-butanol and trityl alcohol

In a dry $50-\mathrm{mL}$, two-necked, round-bottomed flask was placed $\mathrm{MoO}_{2} \mathrm{Cl}_{2}$ ( $19 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in 5 mL of anhydrous toluene. A solution of anhydride ( 15 mmol ) and a given $3^{\circ}$ alcohol ( 10 mmol ) in toluene ( 5 mL ) was slowly added to the above solution and the reaction mixture was stirred for 30 min to 1 hour. To the above solution, diisopropylethylamine ( $1750 \mu \mathrm{~L}, 10 \mathrm{mmol}$ ) was slowly added at ambient temperature. This mixture was refluxed for 1 to 24 hours. After completion of the reaction as monitored by TLC (for the benzoylation of tryl alcohol), the reaction mixture was quenched with cold, saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 50 mL ) at room temperature. The separated organic layer was washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and evaporated. The crude product was purified by distillation. The product obtained was characterized by routine spectroscopic methods.

## Dicetone-D-glucose-3-acetate ${ }^{57}$ and 6-acetate ${ }^{58}$

In a dry $25-\mathrm{mL}$, two-necked, round-bottomed flask was placed $\mathrm{MoO}_{2} \mathrm{Cl}_{2}(1.9$ $\mathrm{mg}, 0.01 \mathrm{mmol}$ ) in 5 mL of anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. To the above solution, acetic anhydride ( $140 \mu \mathrm{~L}, 1.5 \mathrm{mmol}$ ) was added at ambient temperature and stirred for one hour. A solution of diacetone-D-glucose ( $260 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was slowly added to the above bluish solution. The reaction mixture was stirred for 60 hours at ambient temperature. After completion of the reaction as monitored by TLC, the reaction mixture was quenched with cold, saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 20 mL ). ## Cellulose Tricetate ${ }^{63}$

In a dry $50-\mathrm{mL}$, round-bottomed flask was placed cellulose ( 500 mg ) in a $1: 1$ solution of acetic acid and acetic anhydride ( 10 mL ). The mixture was heated at $140{ }^{\circ} \mathrm{C}$ for 8 hours, then gradually cooled down to room temperature. A solution of $\mathrm{MoO}_{2} \mathrm{Cl}_{2}(10 \mathrm{mg})$ in acetic anhydride ( 1 mL ) was slowly added at ambient temperature to above cellulose solution. The resultant mixture was heated at $100-110{ }^{\circ} \mathrm{C}$ for 6 hours. The reaction mixture was quenched with cold, saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 50 mL ) and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{~mL})$. The combined organic layer was washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and evaporated. The crude white product was re-crystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ ether to give 850 mg ( $96 \%$ yield) of cellulose triacetate as white powder.

## 3,5-Bis-[3-(2,2-dimethyl-propionyloxy)-2-hydroxy-propoxy]-4-\{2-[2-(tetrahydro-pyran-2-yl oxy)-ethoxy]-ethoxy\}-benzoic acid methyl ester (8a)

In a dry 50 mL , two-necked, round bottom flask was placed
 $\mathrm{MoO}_{2} \mathrm{Cl}_{2}$ ( $14 \mathrm{mg}, 0.07 \mathrm{mmol}, 15 \mathrm{~mol} \%$ ) in 15 mL of anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. To the above solution, pivalic anhydride ( $90 \mathrm{mg}, 0.48 \mathrm{mmol}$ ), was slowly added at ambient temperature. After for 45 min , a solution of the corresponding tetraol ( $123 \mathrm{mg}, 0.24 \mathrm{mmol}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 5 \mathrm{~mL}$ ) was slowly added to the above dark bluish green solution
and the reaction mixture were stirred at ambient temperature for 32 hours. After completion, reaction mixture was quenched with cold, saturated aqueous $\mathrm{NaHCO}_{3}$ solution ( 5 mL ) and extracted with dichloromethane ( $2 \times 15 \mathrm{~mL}$ ). The separated organic layer was washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated. The crude product was purified by column chromatography on silica gel.
