## Crystal structure determinations of 2

Red crystals of compound 2 were obtained from a mixture of $\mathrm{Et}_{2} \mathrm{O} /$ hexane cooled at $-20^{\circ} \mathrm{C}$ and a suitable sized crystal was mounted in a Lindemann tube and mounted in an Enraf-Nonius CAD 4 automatic four-circle diffractometer whit graphite monochromated MoK $\alpha$ radiation $\chi=0.71073 \AA$ ). Crystallographic and experimental details are summarized in Table 2. Data were collected at room temperature. Intensities were corrected for Lorentz and polarization effects in the usual manner. No absorption or extinction corrections were made. The structure was solved using the WINGX package ${ }^{\# 1}$ by direct methods (SHELXS 97) and refined by least squares against $\mathrm{F}^{2}$ (SHELXL 97) ${ }^{\# 2}$. All non hydrogen atoms were refined anisotropically, and the hydrogen atoms were introduced from geometrical calculations and refined using a riding model with thermal parameters equivalent to those of the carbon atom to which they were attached.
