## I. General information:

Reagents and solvents were purchased from commercial sources and were purified by distillation or recrystallization prior to use. Toluene was freshly distilled from sodium under nitrogen prior to use. Reactions were run under a nitrogen atmosphere. Purification of reaction products was carried out by flash column chromatography using EM Reagent silica gel 60 (230-400 mesh). Analytical thin layer chromatography was performed on EM Reagent 0.25 mm silica gel $60 \mathrm{~F}_{254}$ plates. Visualization was accomplished with UV light, and potassium permanganate or Dragendorff-Munier stains, followed by heating. Melting points were recorded on a Thomas Hoover capillary melting point apparatus and are uncorrected. Infrared spectra were recorded on an ATI Mattson Genesis Series FT-Infrared spectrophotometer. Proton nuclear magnetic resonance spectra ( $\left.{ }^{1} \mathrm{H}-\mathrm{NMR}\right)$ were recorded on a Varian VNMRS-500 MHz instrument and are reported in ppm using solvent as an internal standard ( $\mathrm{CDCl}_{3}$ at $7.26 \mathrm{ppm},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$ at $2.50 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD}$ at 3.31 ppm$)$. Data are reported as app $=$ apparent, $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{dd}=$ doublet of doublets, ddd = doublet of doublet of doublets, dddd = doublet of doublet of doublet of doublets, $\mathrm{m}=$ multiplet, comp = complex; integration; coupling constant(s) in Hz . Proton-decoupled carbon nuclear magnetic resonance spectra ( ${ }^{13} \mathrm{C}$-NMR) were recorded on a Varian VNMRS-500 MHz instrument and are reported in ppm using solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at $77.16 \mathrm{ppm},\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$ at $39.52 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD}$ at 49.00 ppm$)$. Mass spectra were recorded on a Finnigan LCQ-DUO mass spectrometer. HPLC analysis was carried out on an Agilent 1100 series instrument with auto sampler and multiple wavelength detectors. Optical rotations were measured using a 1 mL cell with a 1 dm path length on a Jasco $\mathrm{P}-2000$ polarimeter at 589 nm and at $20^{\circ} \mathrm{C}$. Compounds $\mathbf{1 c},{ }^{1} \mathbf{1 d},{ }^{2} \mathbf{1 i},{ }^{3} \mathbf{2 a},{ }^{4}$ $\mathbf{2 b},{ }^{5} \mathbf{2 c},{ }^{6} \mathbf{2 d},{ }^{7} \mathbf{2 e} \mathbf{e}^{8}$ were prepared according to reported procedures.

## Evaluation of pyridinium salts with different $\mathbf{p} \boldsymbol{K}_{\mathbf{a}}$ values ${ }^{9-12}$

To a flame dried vial was added the pyridine derivative ( $0.0275 \mathrm{mmol}, 11 \mathrm{~mol} \%$ ), thiourea catalyst $\mathbf{2 a}$ $(16 \mathrm{mg}, 0.025 \mathrm{mmol}, 10 \mathrm{~mol} \%)$, tryptophol ( $40 \mathrm{mg}, 0.25 \mathrm{mmol}, 1$ equiv), $4 \AA \mathrm{MS}(100 \mathrm{mg})$ and dry toluene $(2.5 \mathrm{~mL}, 0.1 \mathrm{M})$. The resulting mixture was stirred under nitrogen and $\mathrm{HCl}(10 \mathrm{~mol} \%, 3.5 \mathrm{M}$ in dioxane) was added followed by benzaldehyde ( $30 \mu \mathrm{~L}, 0.3 \mathrm{mmol}, 1.2$ equiv). The reaction was stirred for 24 hours before being quenched with triethylamine $(40 \mu \mathrm{~L})$. The resulting mixture was directly purified by flash chromatography on silica gel topped with Celite.

## General procedure B for the synthesis of thiourea catalysts

To a solution of amino(thio)urea ${ }^{13,14}(0.39 \mathrm{mmol}, 1$ equiv) in dry THF ( $3.9 \mathrm{~mL}, 0.1 \mathrm{M}$ ) was added $o$ phenyl chlorothionoformate ( $70 \mu \mathrm{~L}, 0.51 \mathrm{mmol}, 1.3$ equiv) and $N, N$-diisopropylethylamine ( $68 \mu \mathrm{~L}, 0.39$ $\mathrm{mmol}, 1$ equiv). The resulting solution was stirred at room temperature for 1 h , followed by addition of the amine ( $1.95 \mathrm{mmol}, 5$ equiv). The resulting mixture was stirred at room temperature for the indicated time. Subsequently, saturated aqueous $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$ was added and the mixture was extracted with EtOAc ( $3 \times 10 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 10 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. The resulting solution was then concentrated under reduced pressure and purified by flash chromatography on silica gel.

The resulting mixture was stirred under nitrogen and cooled to $-30^{\circ} \mathrm{C}$ over 15 minutes. Aldehyde ( $0.3 \mathrm{mmol}, 1.2$ equiv) was then added and the reaction was stirred for the indicated time before being quenched with triethylamine $(40 \mu \mathrm{~L})$. The resulting mixture was directly purified by flash chromatography on silica gel topped with Celite.
