## Experimental Section

### Materials

All solvents, 2-(diphenylphosphino)benzaldehyde, 4-methoxyphenyl isothiocyanate, 4-nitrophenyl-3-thiosemicarbazide, hydrazine monohydrate, gold plate, gold(III) chloride hydrate, and 2,2'-thiodiethanol are commercially available and were used without further purification.

### Physical Measurements

Elemental analysis of C, H, N and S were performed on a FISOONS EA 1108 analyzer.  $^1\text{H}$  NMR spectra were recorded on a Varian Mercury 300 spectrometer;  $^{13}\text{C}$  and  $^{31}\text{P}$  NMR spectra ( $\text{H}_3\text{PO}_4$  was used as internal reference) were recorded on a Bruker DRX-500 MHz spectrometer.  $\text{DMSO-d}_6$  was employed as deuterated solvent and chemical shifts were expressed relative to tetramethylsilane. Infrared spectra were measured from KBr pellets on a BRUKER IFS-66V spectrophotometer in the ranges 4000-100 or 500-100  $\text{cm}^{-1}$ . Electrospray ionization mass spectra ( $\text{ESI}^+$ ) were recorded on an API4000 Applied Biosystems mass spectrometer with Triple Quadrupole analyser.

### Synthesis of 4-methoxyphenylthiosemicarbazide

Hydrazine monohydrate (1.52 g, 30 mmol) was slowly added to a solution of 4-methoxyphenyl-isothiocyanate (2.47 g, 15 mmol) in absolute ethanol (20 mL) with stirring at 0 °C (ice bath). After 1 hour the white solid was filtered off, washed with ethanol and diethyl ether and dried under vacuum.

**Scheme S2.** Synthesis of the ligands  $\text{HL}^n$  ( $\text{HL}^1$ ,  $\text{R} = \text{Me}$ ;  $\text{HL}^2$ ,  $\text{R} = \text{Et}$ ;  $\text{HL}^3$ ,  $\text{R} = \text{Ph}$ ;  $\text{HL}^4$ ,  $\text{R} = \text{PhOMe}$ ;  $\text{HL}^5$ ,  $\text{R} = \text{PhNO}_2$ )

### Synthesis of the ligands HL<sup>n</sup>

(HL<sup>1</sup>, R = Me; HL<sup>2</sup>, R = Et; HL<sup>3</sup>, R = Ph; HL<sup>4</sup>, R = PhOMe; HL<sup>5</sup>, R = PhNO<sub>2</sub>)

All ligands were synthesised following the same procedure. We must point out herein that HL<sup>1</sup>, HL<sup>2</sup> and HL<sup>3</sup> were previously reported.<sup>1-3</sup> For that reason we have included here the experimental data for HL<sup>4-5</sup> only. As an example, we can see below the synthesis of HL<sup>4</sup>.

The ligand 4-methoxyphenylthiosemicarbazone, HL<sup>4</sup>, was prepared by condensation of 2-diphenylphosphinobenzaldehyde (1.0 g, 3.4 mmol) with 4-methoxyphenyl-thiosemicarbazide (0.7 g, 3.4 mmol) in absolute ethanol (25 mL). The solution was heated under reflux for 4 h and concentrated with a Dean–Stark trap. The yellow precipitate was collected by filtration. The resulting solid was finally washed with diethyl ether (3 × 10 mL) and dried *in vacuo*.

### Electrochemical synthesis of gold(I) complexes

All syntheses were performed under the same experimental conditions: 0.1 g of ligand electrolysed at 5 mA (10.5-13.5 V) under argon atmosphere. As example we detail below the experimental procedure for the complex  $[\text{Au}_2(\text{L}^1)_2]$ .

#### Electrochemical synthesis of $[\text{Au}_2(\text{L}^1)_2]$

A suspension of the ligand  $\text{HL}^1$  (0.1 g, 0.265 mmol) containing tetraethylammonium perchlorate as supporting electrolyte, a platinum wire as cathode and a gold plate as anode, was electrolysed in degassed acetonitrile (80 mL) for 85 min. The reaction was carried out at 5 mA (10.5 V) under argon atmosphere. The resulting yellow solution was concentrated under reduced pressure until half volume. Slow evaporation from the mother liquors afforded single crystals suitable for X-ray diffraction studies that were filtered, washed with diethyl ether and dried in vacuo, providing 0.093 g of a yellow crystalline product. The structure of this complex was found to be  $[\text{Au}_2(\text{L}^1)_2]$  (**1**).

**\*Caution!** Perchlorate salts are potentially explosive and should be handled with care.
