Axial Base K_{assoc} Values for Coenzyme B₁₂ "Models".

Many axial base K_{assoc} are available for Coenzyme B₁₂ "model" complexes, particularly for the well studied alkylcobaloximes.¹ For example, methylcobaloxime has a pyridine base binding constant^{1f,g} of ca. $2 \times 10^3 \text{ M}^{-1}$ and a *p*-NH₂-pyridine binding constant^{1f} of ca. $1 \times 10^4 \text{ M}^{-1}$ (25 °C; H₂O, ionic strength 1.0 M). Even for the sterically bulky alkyl isopropylcobaloxime, the pyridine binding constant is $484 \pm 18 \text{ M}^{-1}$.^{1f} Tertiary phosphines are also well known to bind tightly to alkylcobaloximes^{1d} [results which contrast dramatically the lack of binding to AdoCbi⁺ reported herein of even the smallest and most basic phosphines, i.e., PMe₃]. In other words, the cobaloxime B₁₂ "models" are very poor quantitative mimics of coenzyme B₁₂'s axial-base binding equilibria, often exhibiting K_{assoc} too large by at least 10^2 .^{1h} (Additional cobaloxime axial-base and related studies are available to the interested reader.^{1j-r})

We note, however, that the Co(SALEN) or Co(SALOPH) B₁₂ models exhibit axial-base properties more like those of B₁₂, for instance axial-base association constants that are weaker than those exhibited by cobaloximes and thus more B₁₂-like (a rare 5 coordinate alkylCo(SALEN) has even been crystallographically characterized²). Also noteworthy is the ca. 10^{11} higher substitution lability of Co(SALEN) than that seen for the analogous cobaloximes,² another "more B₁₂ -like" property. Lippard's recently reported 5 coordinate RCo(tropocoronand) B₁₂ models¹ⁱ are very intriguing in this regard and merit axial-base K_{assoc} studies, and further studies of their apparent stereochemical control of R-Co and Co-B

labilities and bond energies. Furthermore, and as Marzilli has noted,³ the interesting *high-spin* forms of 5 coordinate Co(II)(SALEN or SALOPH) [and possibly of Co(II)(tropocoronands) (?)¹¹] are potentially very significant and worthy of greater study.⁴ It remains, however, to be seen if the Co out-of-plane distortions and associated high spin Co(II) form in *B₁₂ models* can be analogously demonstrated in *cobalamin* chemistry. If so, then they become very interesting candidates to possibly help explain the enzyme's 10¹² acceleration of the AdoCbl Co-C homolysis step.⁵ In addition, as also noted in the main text, quantitative K_{assoc} , ΔH , and ΔS measurements in ethylene glycol for the following *Ado*-alkyl complexes would be of value and would permit a more quantitative comparison to the AdoCbl⁺ studies provided in the main text: *Adocobaloxime*, *AdoCo*(SALEN/SALOPH), and *AdoCo*(tropocoronand). Also of general interest would be studies measuring axial-base K_{assoc} , ΔH , and ΔS values for Co(II)cobaloxime, Co(II)(SALEN/SALOPH), and Co(II)(tropocoronand).

Attempted Studies of K_{assoc} for AdoCbl⁺ Plus Common Phosphines

Experimental details, plus a brief discussion of the results, are provided in the main text. The key result, however, is that in no case was phosphine binding detectable.

Table A. K_{assoc} (25 °C) Upper Limits for AdoCbl⁺ Plus Phosphines in Ethylene Glycol.

Phosphine (PR ₃)	[Phosphine] (M)	Equivalents of phosphine	K_{assoc}^a (M ⁻¹) 25 °C	Cone angle, ^b (degrees)
P(cyclohexyl) ₃	1.0 x 10 ⁻²	188	<5.0	>170
P(<i>i</i> -propyl) ₃	3.0 x 10 ⁻²	206	<2.2	160
P(Ph) ₂ (<i>n</i> -butyl)	3.0 x 10 ⁻²	165	<1.8	135
P(<i>n</i> -butyl) ₃	3.0 x 10 ⁻²	173	<1.8	132
P(ethyl) ₃	1.6 x 10 ⁻¹	1000	<0.3	132
P(methyl) ₃	3.0 x 10 ⁻¹	1562	<0.2	118

Overlays of AdoCbi⁺ UV-visible spectra with differing concentrations of base.

As described in the Experimental section of the main text, the K_{assoc} constants were determined by measuring the absorbance as a function of base concentration and temperature. Each scan was run on a separate cuvette containing nearly identical concentrations of AdoCbi⁺ (the slight deviance in isosbestic points in some of the runs is due to a slightly different corrin concentration in the different cuvettes). Base concentrations ranged from 250 to 10,000 equivalents (relative to the [corrin]). Representative examples of the spectra are provided below. (Note that, in order to have maximal Δ absorbance changes at the wavelengths followed [520, 455 and, where possible as a check, 415 and 380 nm], the absorbance at < 330 nm is deliberately in a unreliable absorbance range of > 1.5 .)

Figures A-E. Overlaid spectra of AdoCbi⁺ (ca. 2 to 2.5×10^{-2} M) in ethylene glycol (25 °C) as a function of added base.

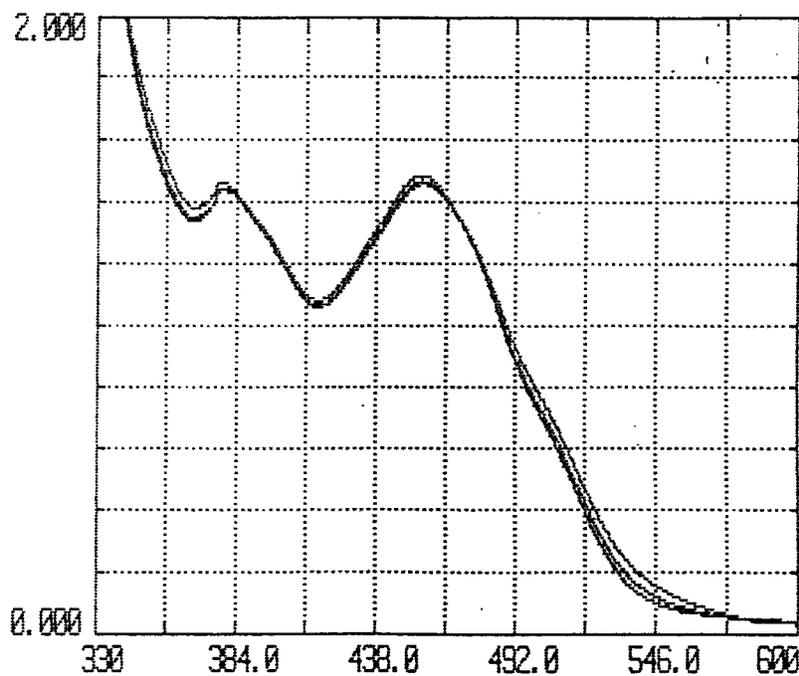

Figure A. AdoCbi⁺ plus *p*-CN-pyridine (2.0 to 0.5 M).

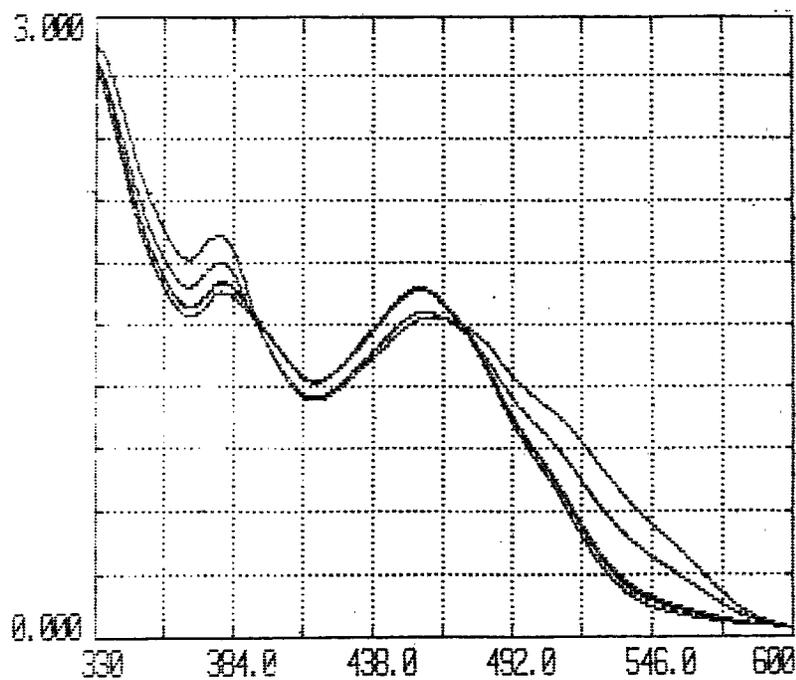

Figure B. AdoCbi⁺ plus pyridine (2.0 to 0.25 M).

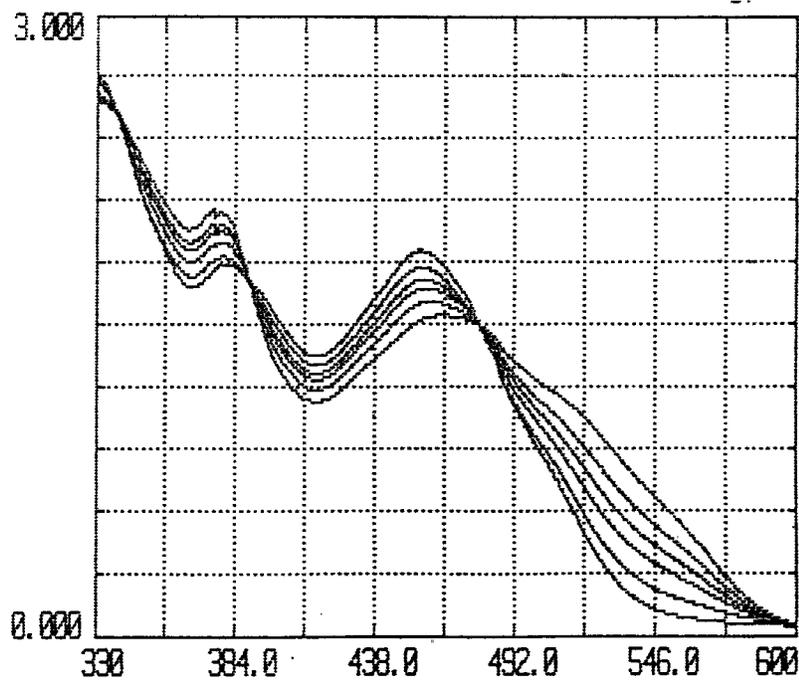

Figure C. AdoCbi⁺ plus *p*-CH₃-pyridine (2.0 to 0.125 M).

5

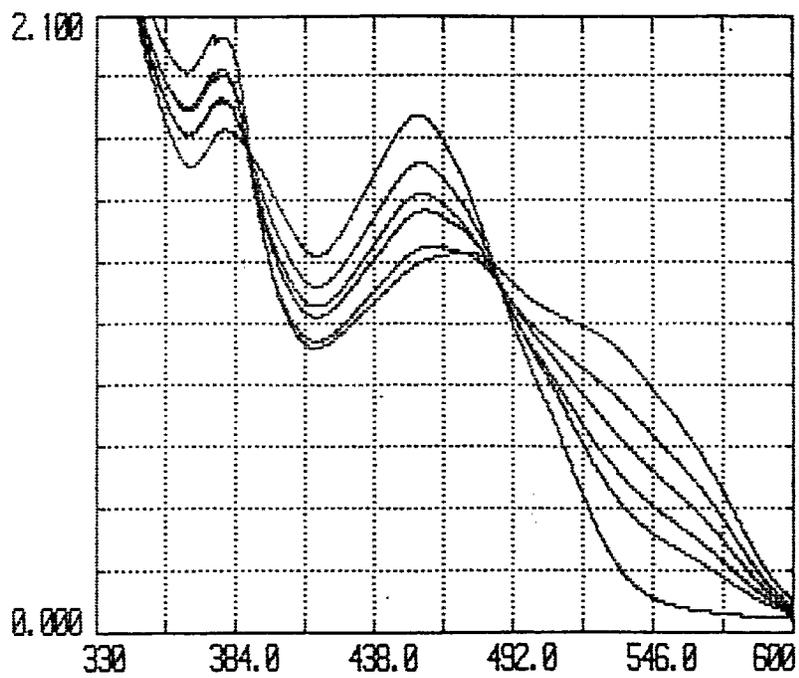

Figure D. AdoCbi⁺ plus *p*-NH₂-pyridine (2.0 to 0.125 M).

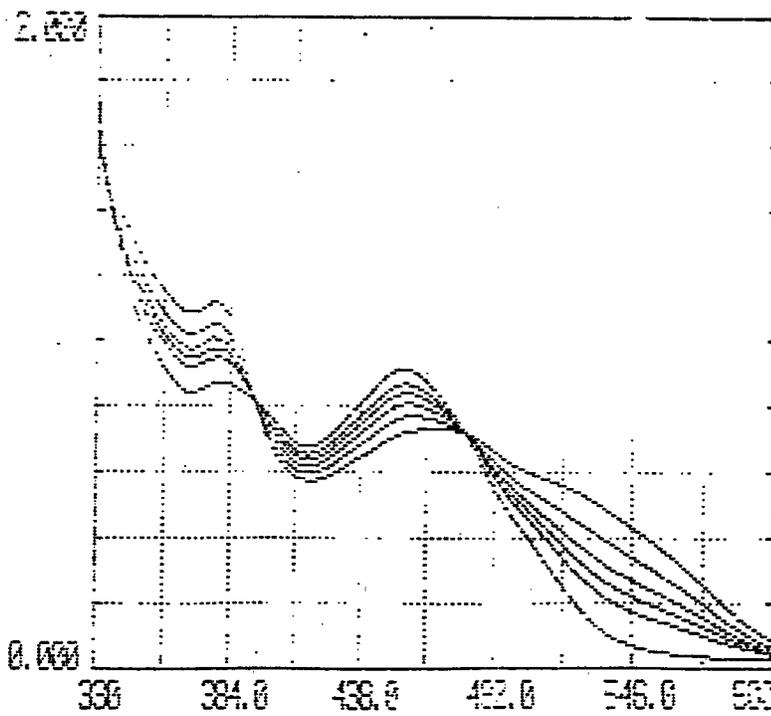

Figure E. AdoCbi⁺ plus *p*-Me₂N-pyridine (1.0 to 6.25 x 10⁻² M).

Representative plots using equations 1 or 2.

For an equilibria of the form $A + B \rightleftharpoons C$,

where $A = \text{AdoCbi}^+$, $B = \text{Base}$, $C = [\text{AdoCbi} \cdot \text{base}^+]$:

$$(1) \quad \text{Abs} = \frac{-(\text{Abs} - \text{Abs}_0)}{[\text{B}_0]} \cdot \frac{1}{K_{\text{assoc}}} + \text{Abs}_\infty$$

$$(2) \quad K^{-1} = \frac{(\text{Abs} - \text{Abs}_0)}{(\epsilon_c - \epsilon_a)} - [\text{A}_0] - [\text{B}_0] + \frac{([\text{A}_0][\text{B}_0](\epsilon_c - \epsilon_a))}{(\text{Abs} - \text{Abs}_0)}$$

Using equation 1 (for a derivation, see reference 21b provided in the main text), a plot of $(\text{Abs} - \text{Abs}_0) / [\text{B}_0]$ vs. Abs is made; the slope = K^{-1} and the y intercept = Abs_∞ , the all-base-on absorbance. The only limitation to this equation is that the $[\text{Base}]$ must be greater than the $[\text{AdoCbi}^+]$.

Another method for deriving the desired K_{assoc} is Drago's method,⁶ eq. 2. The data is plotted by estimating the extinction coefficient of the base-on AdoCbi^+ and solving the equation for K^{-1} at a given concentration of base. Three or more ϵ_c estimates yields a straight line. This process is repeated at three or more $[\text{Base}]$ values, resulting in a graph consisting of three intersecting lines. K^{-1} and ϵ_c are extrapolated from the center of the triangle formed, and error bars are estimated from the triangle's extremes.

⁶Drago, R. S. *Physical Methods in Chemistry*; W. B. Saunders: Philadelphia, 1977; p 90.

Representative examples of the various plots are provided below.

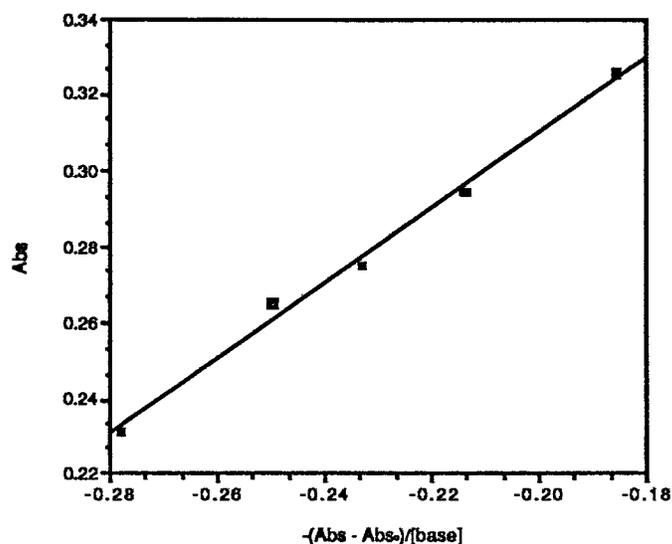

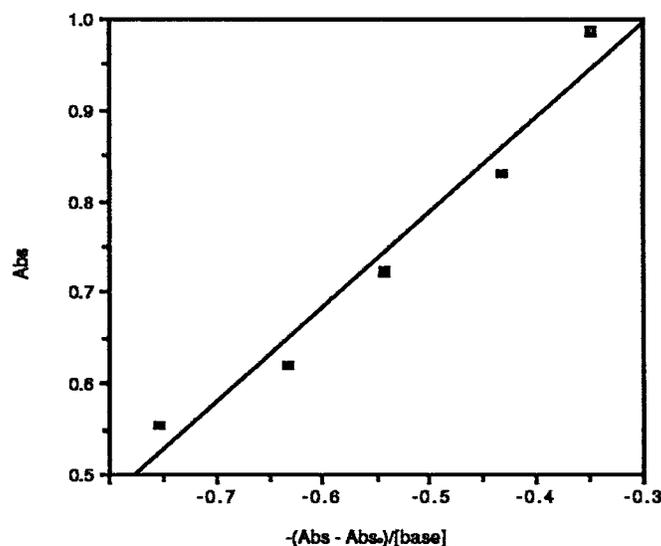

Figure F. AdoCbi⁺ plus pyridine (25 °C; 520 nm data), Abs vs. $-(\text{Abs} - \text{Abs}_0)/[\text{base}]$ plot; $y = 0.99x + 0.51$, $R^2 = 0.992$. Data collected at 380 or 455 nm gave the same results within experimental error.

Figures G. AdoCbi⁺ plus CH₃-pyridine (25 °C, 520 nm data) linear regression of Abs vs. $-(\text{Abs} - \text{Abs}_0)/[\text{base}]$; $y = 1.05x + 1.3$, $R^2 = 0.96$. Data collected at 380, 415, or 455 nm gave the same results within experimental error, as did "Drago plots" of the 380, 455 or 520 nm data.

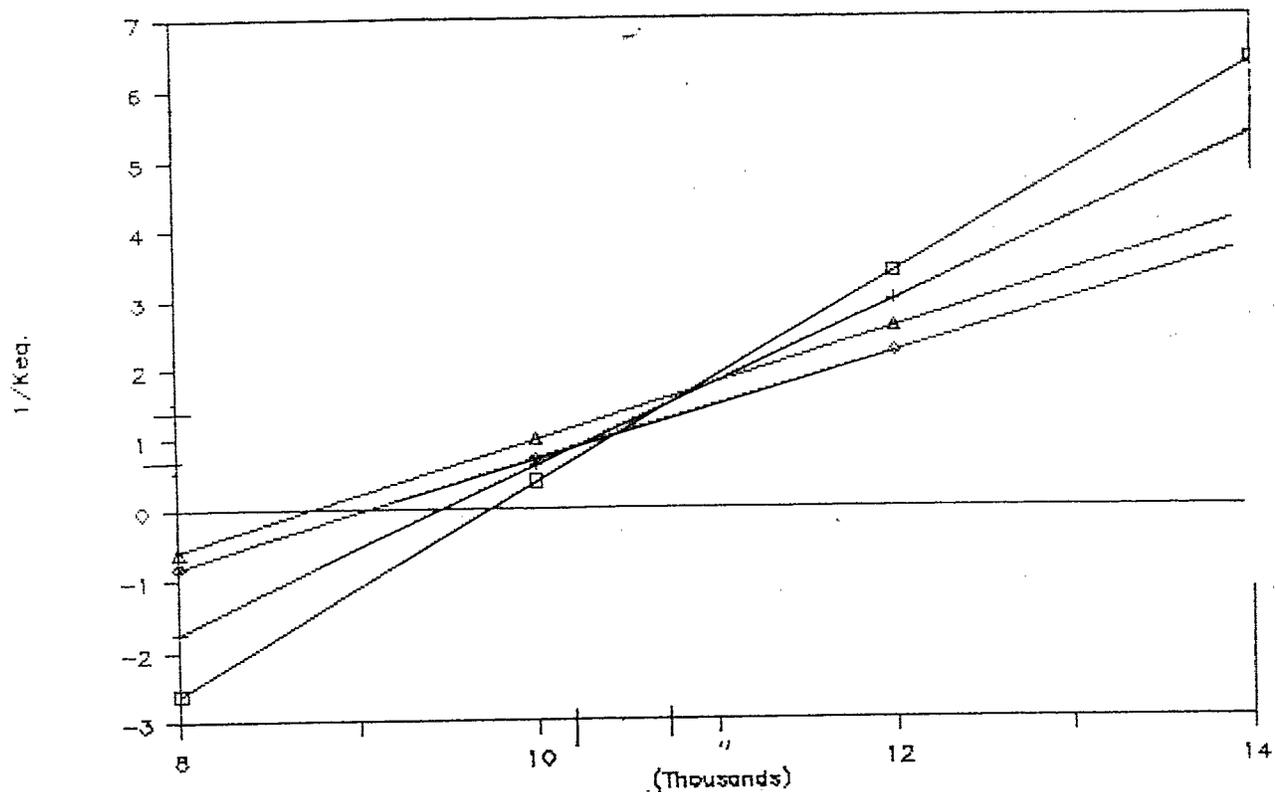

Figure H. AdoCbi⁺ plus CH₃-pyridine "Drago plot" of the 380 nm data. The center of the resultant triangle yields $K^{-1} = 1$, while the extremes of the triangle yielded the error estimates ± 0.33 .

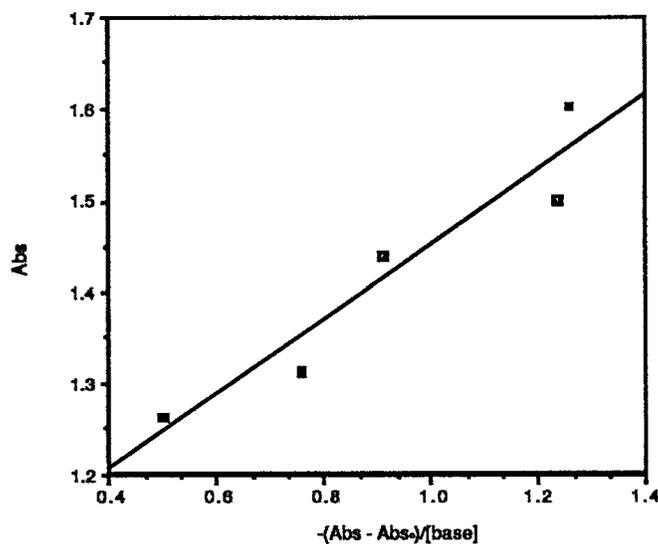

Figure I. AdoCbi⁺ plus NH₂-pyridine (25 °C, 455 nm data) Abs vs. $-(\text{Abs} - \text{Abs}_0)/[\text{base}]$ plot; $y = 0.408x + 1.04$, $R^2 = 0.911$. Data collected at 380, 415, or 520 nm gave the same results within experimental error, as did "Drago plots" of the 415 or 520 nm data.

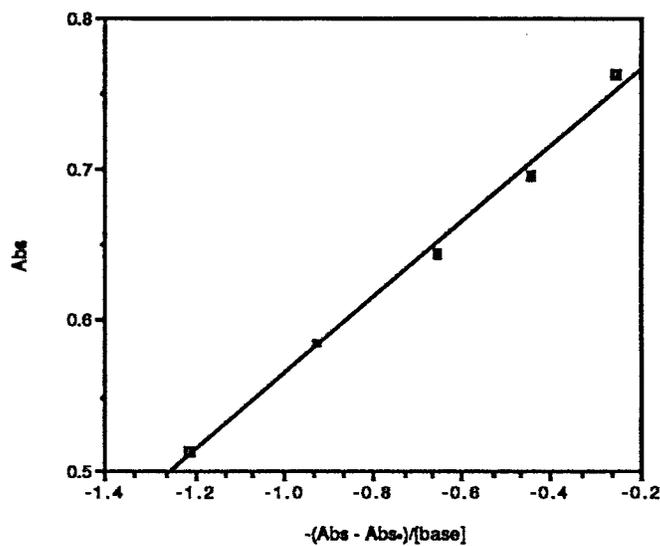

Figure J. AdoCbi⁺ plus Me₂N-pyridine (10°C; 520 nm data), Abs vs. $-(Abs - Abs_0)/[base]$ plot; $y = 0.252x + 0.82$, $R^2 = 0.993$. Data collected at 380 or 455 nm gave the same results within experimental error.

ln K_{assoc.} vs. 1/T plots.

From the K_{assoc.} values measured at several different temperatures, the thermodynamic parameters ΔH and ΔS were obtained in the usual fashion by plotting $\ln K_{\text{assoc.}}$ vs. $1/T$, where the slope yields $-\Delta H/R$ and the y-intercept yields $\Delta S/R$. All plots are provided below.

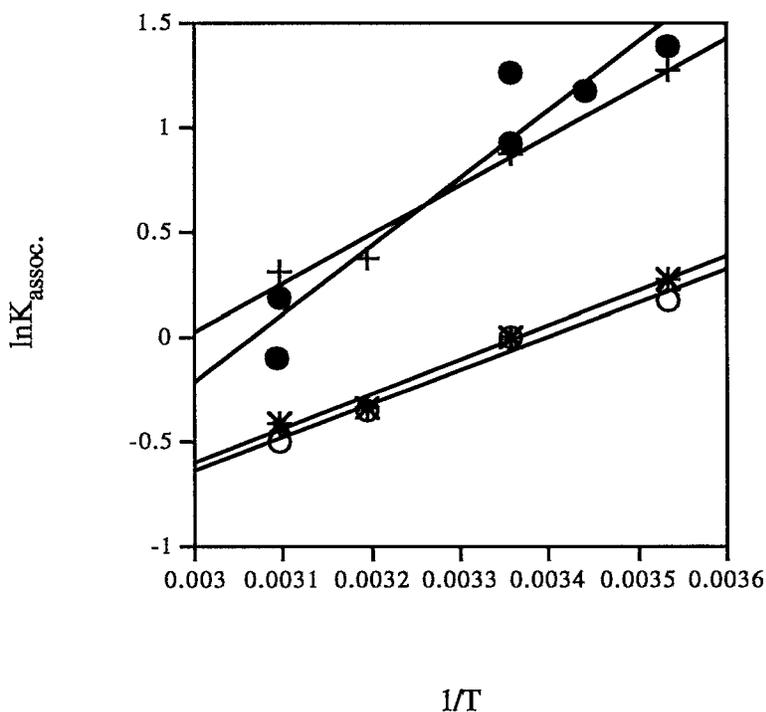

Figure K. $\ln K_{\text{assoc.}}$ vs. $1/T$ plots of AdoCbi⁺ plus pyridine [O; $y = (1.64 \times 10^3) x - 5.57$, $R^2 = 0.976$]; plus CH₃-pyridine [*; $y = (1.67 \times 10^3) x - 5.65$, $R^2 = 0.993$]; plus NH₂-pyridine [+; $y = (2.28 \times 10^3) x - 6.78$, $R^2 = 0.977$], or plus Me₂N-pyridine [●; $y = (3.25 \times 10^3) x - 9.97$, $R^2 = 0.914$].

Attempted AdoCbi⁺ K_{assoc} Studies with RSH/RS⁻

See the main text for experimental details and for a brief discussion of these results. However, the key conclusion from the following table of results is that, at least for each case and under the conditions tested, no thiol or thiolate α -axial binding could be detected.

Table B. K_{assoc}. Upper Limits for AdoCbi⁺ Plus RSH or RS⁻ at 25 °C in Ethylene Glycol.

RSH (or thiolate conjugate base) ^a	pK _a ^b	solvent; pH	25 °C K _{assoc} . (M ⁻¹)
β -mercaptoethanol	9.5	14.3 M (neat) β -mercaptoethanol	<0.01
β -mercaptoethanol	9.5	ethylene glycol	<0.53
β -mercaptoethanol	" "	pH 7.2 aqueous ^c	<0.47
β -mercaptoethanol ^a	" "	pH 10 aqueous ^c	<0.28
dithioerythritol	pK _{a1} = 9.2 pK _{a2} = 9.9	pH 7.2 aqueous	<0.53
dithioerythritol ^a	" " "	pH 10 aqueous	<0.26
glutathione	9.4	pH 7.2 aqueous	<0.19
glutathione ^a	" "	pH 10 aqueous	<0.21

(a) Thiolate (or, for dithioerythritol, dithiolate) form of the corresponding thiol (or dithiol).
 (b) pK_a values are from Houk, J.; Whitesides, G. M. *J. Am. Chem. Soc.* 1987, 109, 6825. (c) Aqueous solutions were prepared by degassing (via 3-freeze-pump-thaw cycles) deionized H₂O, then buffering with 0.05 M phosphate. Any necessary slight pH adjustments were then made by the dropwise addition of 10% NaOH.
