## Experimental Procedures

## Materials

Mbelliferone, allyl bromide, hexadecyltrimethylammonium bromide (CTAB), tetraethyl orthosilicate (TEOS), (3-aminopropyl)triethoxysilane (APTES), 2-(N-morpholino)ethanesulfonic acid (MES), N-hydroxysulfosuccinimide sodium salt (sulfo-NHS), 2,5-Dihydroxybenzoic acid (DHB), tetraethylammonium borohydride (TEAB), $\mathrm{CH}_{2} \mathrm{O}, \mathrm{CD}_{2} \mathrm{O}, \mathrm{NaBH}_{3} \mathrm{CN}$, formic acid (FA), trifluoroacetic acid (TFA), bovine serum albumin (BSA), dithiothreitol (DTT), iodoracetamide (IAA), ethylenediaminetetraacetic acid (EDTA), ethylene glycol tetraacetic acid (EGTA), trypsin, protease inhibitor Cocktail, $\mathrm{NaCl}, \quad \mathrm{K}_{2} \mathrm{CO}_{3}, \quad \mathrm{Pt} \quad$ (dvs) [platinum(0)-1,3-divinyl-1,1,3,3-tetramethyldisiloxane complex] were purchased from Sigma Aldrich (St. Louis, MO). Triethoxysilane, N-(3-dimethylaminopropyl)-N`-ethylcarbodiimide hydrochloride (EDC) were obtained from J\&K Scientific Ltd (Beijing, China). ACN was HPLC grade and obtained from Merck (Darmstadt, Germany). RPMI 1640 cell culture medium and penicillin/streptomycin solution (100×) were obtained from Gibco Invitrogen Corporation (Carlsbad, CA). Reagents for SILAC labeling, including L-Lysine-2HCl, D4 L-Lysine-2HCl, lysine-depleted RPMI 1640 medium and dialyzed fetal bovine serum (FBS) were obtained from Thermo Scientific (USA). TAT peptides $\left(\mathrm{NH}_{2}\right.$-YGRKKRRQRRR-COOH) were purchased from Chinese Peptide Company (Hangzhou, China) with the purity at $95 \%$. Other reagents, including toluene, $\mathrm{NH}_{4} \mathrm{NO}_{3}$, ethanol, isopropanol, HCl were of analytical grade. Deionized water was purified using a Milli-Q water system (Millipore, USA).

## The construction of controllable nanocarrier based on MSN

The MSN nanoparticles were synthesized based on a reported strategy. ${ }^{[1]}$ Basically, $350 \mu \mathrm{~L} \mathrm{NaOH}$ ( 2 M ) was added in 50 mL CTAB ( 5 mM ), then 0.5 mL TEOS was added into the solution under vigorous stirring; the MSN was formed at $60{ }^{\circ} \mathrm{C}$ for 2 h . The products were collected by centrifugation, washed with ethanol and $\mathrm{H}_{2} \mathrm{O}$ for 3 times, and dried in a vacuum oven at $60{ }^{\circ} \mathrm{C}$ overnight.

The synthesis of 7-[(3-triethoxysilyl)propoxy]coumarin and construction of MSN-coumarin was followed the previous report with a few modifications. ${ }^{[2]}$ As a general procedure, 600 mg umbelliferone ( 3.0 mmol ) was dissolved in 30 mL acetone, followed by the addition of 500 mg $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( 3.6 mmol ). Later, 435 mg allyl bromide ( 3.6 mmol ) was dropwise added in the solution, and
the reaction was kept under reflux for 5 h . After filtration, 7 -allyloxycoumarin was collected and purified by recrystallization using ethanol, and dried in a vacuum oven at $60{ }^{\circ} \mathrm{C}$ overnight. 324 mg 7-allyloxycoumarin ( 1.6 mmol ) and 332 mg triethoxysilane ( 1.76 mmol ) was dissolved in 20 mL toluene under $\quad \mathrm{N}_{2} \quad$ atmosphere, after which $80 \quad \mu \mathrm{~L} \quad \mathrm{Pt} \quad$ (dvs) [platinum(0)-1,3-divinyl-1,1,3,3-tetramethyldisiloxane complex] ( 2 mM in toluene) was further added; the reaction would be finished at room temperature for 20 h .

To link 7-[(3-triethoxysilyl)propoxy]coumarin on the MSN, 200 mg MSN was first dispersed in 20 mL n-hexane, and the 40 mg 7 -[(3-triethoxysilyl)propoxy]coumarin (in 1 mL n-hexane) was added, where the mixture was stirred at room temperature for 10 min . The n -hexane was then removed by vacuum distillation. The products of MSN-coumarin were re-dispersed in ethanol containing $\mathrm{NH}_{4} \mathrm{NO}_{3}(0.5 \mathrm{mg} / \mathrm{mL})$, and CTAB templates were removed by ion exchange at $70{ }^{\circ} \mathrm{C}$ for 2 hours. Finally, the MSN-coumarin was collected by centrifugation, washed with ethanol until no 7-[(3-triethoxysilyl)propoxy]coumarin left, dried in a vacuum oven and stored under dry condition.

Before further functionalization, the MSN-coumarin was treated with APTES to form the amino groups on the nanoprobes. TAT peptides were linked on the MSN-coumarin through the EDC/sulfo-NHS strategy. $2 \mu \mathrm{~mol}$ of TAT peptides were first dissolved in 1 mL 2-morpholinoethanesulfonic acid (MES) buffer ( $0.1 \mathrm{M} \mathrm{MES}, 0.5 \mathrm{M} \mathrm{NaCl}, \mathrm{pH}=6.0$ ), followed by the addition of $20 \mu \mathrm{~mol}$ EDC and $50 \mu \mathrm{~mol}$ sulfo-NHS, and the activation of TAT peptides was achieved at room temperature for 15 min .100 mg aminated MSN-coumarin (in 10 mL PBS buffer, $\mathrm{pH}=7.4$ ) was mixed with the activated TAT peptides, and the mixture was kept in room temperature for 2 h . Finally, the products of MSNcg were collected by centrifugation, washed with ethanol and $\mathrm{H}_{2} \mathrm{O}$, dried in a vacuum oven and stored under dry condition before further application.

## Characterization of the MSN and MSNcg

The TEM images of MSN were obtained using a JEM-2000 EX (JEOL, Japan) electronic microscope using the accelerating voltage at 120 keV . The nitrogen adsorption curve of MSN was measured with the static-volumetric method at 77 K using an ASAP 2010 instrument (Micromeritics), and the specific area, pore size and pore volume were calculated by the nitrogen adsorption curve using the BET equation. The FTIR analysis of MSNcg was carried out using the Spectrum GX (PE, USA).

Adsorption capacity of peptides in MSN
$100 \mu \mathrm{~g}$ MSN was mixed with $100 \mu \mathrm{~g}$ BSA digested peptides (in PBS buffer) for required incubation times $(0,5,10,15,30,60,120 \mathrm{~min})$ at room temperature, after which MSN was removed by centrifugation. The amounts of peptides in the solution before and after extraction were measured by HPLC, and the extraction amounts were calculated by comparing the changed amounts of peptides in the supernatants during the extraction procedure.

To investigate the mechanism of peptide adsorption in the MSN based materials, different concentration $(0,5,10,15,20,30 \%, \mathrm{v} / \mathrm{v})$ of methanol was utilized to elute the peptides adsorbed in the pores, and the recovery of eluted peptides was measured with UV spectrometry.

## Cell viability assay

Viability of HeLa cells under the treatment of MSNcg was measured by Cell Counting Kit-8 (CCK-8, DOJINDO, Japan) according to the protocol. At first, 5000 HeLa cells were pre-planted in a 96-well plate, and then MSNcg was added and incubated with cells as required. $1000,2000,3000$, $4000,5000 \mathrm{HeLa}$ cells were also planted in the plate to serve as the standard data of cell viability. After the treatments, the nanoprobes were removed and cells were washed with PBS buffer for 3 times. The eluted CCK-8 solution was added and incubated with cells for 30 min , the absorbance value was obtained by a microplate reader (BioRek, USA) at 450 nm . All the measurements were repeated for six times.

To test the influence of UV irradiation (at 254 nm ) during the pore opening procedure, the apoptotic ratio of cells after the UV treatment was evaluated by flow cytometry. The treated cells were stained with FITC Annexin V Apoptosis Detection Kit I (BD, Franklin Lakes, NJ) following the instructions, and all the measurements were performed with a FACS Vantage SE flow cytometer from BD (Franklin Lakes, NJ). All the data were technically repeated for 3 times.

## Cell culture and stable isotope labeling by amino acids in cell culture (SILAC)

HeLa cells were cultured using RPMI 1640 culture medium containing $10 \%$ bovine serum (BS) and penicillin/streptomycin $(1 \times)$ at $37{ }^{\circ} \mathrm{C}$ under $5 \% \mathrm{CO}_{2}$ atmosphere, and the cells were split with a 90\% confluency. SILAC treated HeLa cells were cultured in lysine-depleted 1640 medium containing $0.1 \mathrm{mg} / \mathrm{mL}$ D4 L-lysine (K4).

Tryptic digestion of BSA and dimethylation isotope labeling of digested peptides
Protein digestion was followed a protocol developed in our lab. ${ }^{[3]}$ Briefly, 1 mg BSA was dissolved and denatured in $150 \mu \mathrm{~L}$ solution of 8 M urea and $100 \mathrm{mM} \mathrm{TEAB}(\mathrm{pH}=8.0)$, reduced by

DTT ( $2 \mu \mathrm{~mol}$ ), and alkylated by IAA ( $4 \mu \mathrm{~mol}$ ). Then, 1 mL 100 mM TEAB buffer ( $\mathrm{pH}=8.0$ ) was added into the protein solution, followed by the addition of $4 \mu \mathrm{~g}$ trypsin. The digestion was kept at $37{ }^{\circ} \mathrm{C}$ for 20 h . The digested peptides were then went through dimethylation isotope labeling by adding the light labeling reagent $\left(0.2 \% \mathrm{CH}_{2} \mathrm{O}\right.$ and 30 mM NaBH 3 CN$)$ and heavy labeling reagent $\left(0.2 \% \mathrm{CD}_{2} \mathrm{O}\right.$ and $\left.30 \mathrm{mM} \mathrm{NaBH} \mathrm{N}_{3} \mathrm{CN}\right)$ as required. ${ }^{[4]}$ Finally, the isotope labeled peptides were desalted with reverse phase C18 SPE columns, lyophilized, and stored at $-80{ }^{\circ} \mathrm{C}$ before further usage.

## Intracellular localization of MSNcg by TEM imaging

After HeLa cells were treated by MSNcg and MSN-coumarin ( $200 \mu \mathrm{~g} / \mathrm{mL}$ ) for 1 h , the cells were washed with PBS buffer for three times, fixed by PBS buffer containing $2.5 \%$ glutaraldehyde overnight at $4{ }^{\circ} \mathrm{C}$ and further fixed with PBS buffer containing $1 \% \mathrm{OsO}_{4}$. The cell pellets were dehydrated using ethanol, treated using propylene oxide and embedded in Epon. Then, the cell slices (ca. 80 nm ) were obtained, stained with uranyl acetate and lead citrate. The observation of the intracellular localization of MSNcg was carried out using a JEM-2000 EX (JEOL, Japan) electronic microscope with an accelerating voltage at 120 keV .

## Controlling the coumarin gates inside live HeLa cells

8 mg MSNcg was mixed with 4 mL DOX solution ( $0.5 \mathrm{mg} / \mathrm{mL}$ ) and incubated overnight under gentle vibration. After that, the mixture was irradiated at 310 nm for 5 min to close the gates. DOX@MSNcg was washed completely with PBS buffer. The DOX@MSNcg ( $25 \mu \mathrm{~g} / \mathrm{mL}$ in cell culture medium) was ingested by HeLa cells during incubation for 12 h . Then, the cells were treated with UV irradiation at 254 nm for 2 min , where the cells in the control group were not irradiated for gate opening, and the release of DOX in cells was observed by a fluorescence microscope (Olympus) after 10 min .

## Controllable extraction of peptides in vitro and in live HeLa cells

BSA digested peptides were utilized as standard peptides for in vitro extraction. As a general procedure, coumarin gates on the MSNcg were first closed by irradiation $>310 \mathrm{~nm}$ for 10 min using a high pressure mercury lamp coupled with a long-wave-pass filter. 1 mg BSA digested peptides (heavy or light isotope labeled) were mixed with 4 mg MSNcg, and the coumarin gates were opened by irradiated at 256 nm for 2 min . The adsorption equilibrium could be reached within 15 min (by optimization using the MSN), after which the gates on MSNcg were closed again and the MSNcg
was collected by centrifugation. Non-specific adsorbed peptides outside MSNcg were removing with the washing solution ( $15 \%$ methanol, $85 \% \mathrm{H}_{2} \mathrm{O}$ containing $0.1 \% \mathrm{TFA}$ ) until no peptides could be detected by MALDI-TOF analysis. Finally, the gates of MSNcg were opened again and the adsorbed peptides were eluted with the washing solution, lyophilized and stored at $-80^{\circ} \mathrm{C}$ before analysis.

The in vivo extraction went through a similar procedure with the in vitro extraction. Briefly, MSNcg was treated with 10 min irradiation (>310 nm) for gate closing, and then the MSNcg were dispersed in the culture medium ( $200 \mu \mathrm{~g} / \mathrm{mL}$ ) and incubated with HeLa cells for 1 h . After internalization, the treated cells were washed with PBS buffer for several times to fully remove the endogenous peptides in bovine serum. Then, the cells were collected, followed by the initiation (open the coumarin gate) and termination (close the coumarin gate) of the adsorption. The cells were later lysed using the lysing buffer ( 20 mM Hepes, 25 mM SDS, 0.5 mM EGTA, 1 mM EDTA, 1 mM PMSF, $2 \%$ Cocktail, $\mathrm{pH}=7.4$ ), and the ingested MSNcg with the adsorbed peptides were gathered using centrifugation and washed using the washing buffer. Finally, the coumarin gate of MSNcg was opened and captured peptides were eluted as described above.

## MALDI-TOF analysis of extracted peptides

MALDI-TOF analysis was carried out with AB Sciex 5800 MALDI-TOF/TOF mass spectrometer (AB, SCIEX, USA) using linear positive ion mode with a pulsed laser at 355 nm . 2,5-Dihydroxybenzoic acid was sissolved in $\mathrm{ACN} / \mathrm{H}_{2} \mathrm{O} / \mathrm{H}_{3} \mathrm{PO}_{4}(70: 29: 1, \mathrm{v} / \mathrm{v} / \mathrm{v})$ as matrix. Before analysis, peptides were disoved in $0.1 \%$ FA solution, and $0.5 \mu \mathrm{~L}$ of peptides and $0.5 \mu \mathrm{~L}$ DHB matrix were added on the sample plate stepwised.

LC-MS analysis of the intracellular peptides from HeLa cells
The bottom up analysis of extracted peptides was carried out using Q Exactive (Thermo Scientific, Waltham, MA). The peptides was re-dissolved in $0.1 \%$ FA (Buffer A), and loaded to a $3 \mathrm{~cm} \times 200$ $\mu \mathrm{m}$ trap column packed with C18 AQ beads (Michrom Bio Resources, $5 \mu \mathrm{~m}, 120 \AA$, USA) using Buffer A at $5 \mu \mathrm{~L} / \mathrm{min}$, and separated by a $15 \mathrm{~cm} \times 75 \mu \mathrm{~m}$ C18 AQ column ( $5 \mu \mathrm{~m}, 120 \AA$, USA) at 300 $\mathrm{nL} / \mathrm{min}$ with a gradient of $10 \% \sim 43 \%$ Buffer B ( $80 \% \mathrm{ACN}, 0.1 \% \mathrm{FA}$ ) in 90 min . The full scan was obtained at a resolution of $70000(\mathrm{~m} / \mathrm{z}=200)$ with an AGC of $1 \times 10^{6}$, and the Top 15 ions (intensity above $1 e^{4}$ ) was subjected to HCD fragmentation at a normalized collision energy of 28 with an constant injection time of 60 ms . The product ion was analysis with a resolution of $17500(\mathrm{~m} / \mathrm{z}=200)$. The dynamic exclusion was enabled with a value of 30 s .

## Data processing

The data LC-MS/MS analysis were searched against human database (Uniprot_human, version 201307) by Thermo Proteome Discoverer ${ }^{\text {TM }}$ (Thermo Scientific, Waltham, MA; version 1.4.1.14) using Sequest HT strategy. No enzyme was selected for digestion with unspecific cleavage sites. Oxidation of methionine was selected as the dynamic modification. Precursor and fragment mass tolerance were set at 20 ppm and 0.05 Da , respectively. The false positive rates for identification of both proteins and peptides were less than $1 \%$.
