

8b

**8c****1-(3-Benzoyl-octahydro-pentalen-1-yl)-ethanone (8c).**

To a solution of $\text{Co}(\text{dpm})_2$ (87 mg, 0.204 mmol, 10 mol%) in dichloroethane (0.45 M) at room temperature was added methylphenylsilane (1.1 mL, 8.0 mmol, 400 mol%). The reaction mixture was allowed to stir for 30 min., at which point a dichloroethane solution of 1-phenyl-2-deca-2,7-diene-1,9-dione (**8a**) (500 mg, 2.06 mmol) was added via syringe. The reaction progress was monitored by TLC. Upon complete consumption of starting materials, the reaction mixture was quenched with methanol/10% $\text{HCl}_{\text{(aq)}}$ and allowed to stir for 30 minutes. The reaction mixture was partitioned between ethyl acetate and $\text{NH}_4\text{Cl}_{\text{(aq)}}$. The aqueous layer was extracted and the combined organic extracts were dried (Na_2SO_4) and filtered. The solvent was evaporated and the reaction was purified via flash chromatography (SiO_2 : 9:1, hexanes:ethyl acetate) to provide **8b** (25mg) in 5% yield and **8c** (325mg) in 65% yield.

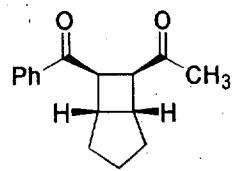

Mp = 77-78 °C.

$^1\text{H NMR}$ (CDCl_3 , 300 MHz): δ 7.81 (m, 2H), 7.46 (m, 3H), 3.80 (dd, J = 5.1, 9.6 Hz, 1H), 3.02 (m, 3H), 2.02 (s, 3H), 1.79 (m, 6H).

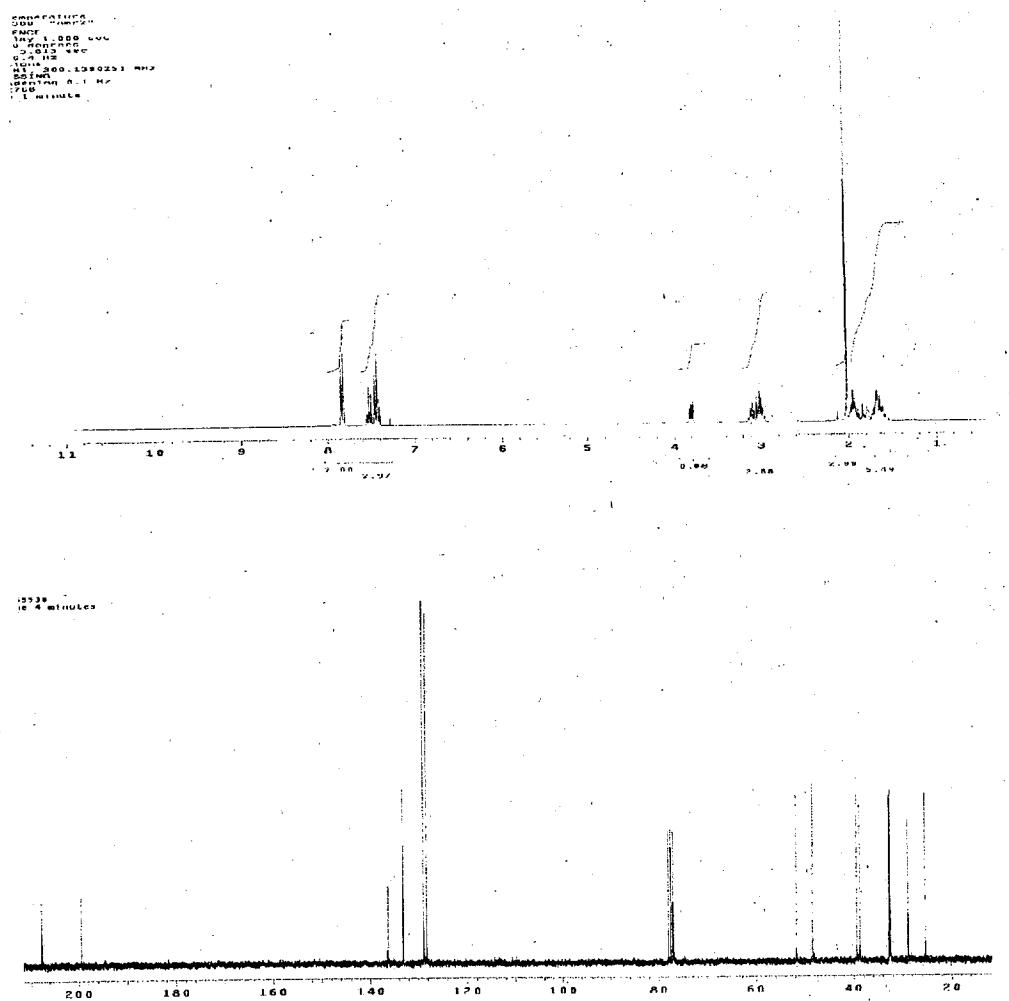

$^{13}\text{C NMR}$ (CDCl_3 , 75 MHz): δ 207.7, 199.4, 136.4, 133.1, 128.9, 128.2, 51.7, 48.3, 39.4, 38.7, 32.7, 32.5, 28.8, 25.4.

IR (neat): 3055, 2948, 2858, 1706, 1678, 1448, 1356, 1264, 1218, 739 cm^{-1} .

HRMS: Calcd for $\text{C}_{16}\text{H}_{18}\text{O}_2$ [$\text{M}+1$] 243.1385, found 243.1387.

Figure 1. View of **1b** showing the atom labeling scheme. Displacement ellipsoids are scaled to the 50% probability level. Hydrogen atoms are drawn to an arbitrary size.

Figure 2. View of the H-bound dimer formed by **1b**. Displacement ellipsoids are scaled to the 50% probability level. Hydrogen atoms are drawn to an arbitrary size. Dashed lines indicate the H-bonding interactions. The two molecules are related by a crystallographic inversion center at $0, 0, \frac{1}{2}$. The geometry of the interaction is: O₁-H⁺O⁻O₂ (related by $-x, -y, 1-z$), O⁻O⁻ 2.859(1) \AA , H⁺O 1.99(2) \AA , O-H⁺O 161(2) $^\circ$.

Figure 3. Unit cell packing diagram for **1b**. The view is approximately down the **b** axis.

X-ray Experimental for C₁₃H₁₆O₂: Crystals grew as colorless prisms by slow evaporation from ethylacetate and hexanes. The data crystal was cut into a trigonal prism that had approximate dimensions; 0.33 x 0.33 x 0.10 mm. The data were collected on a Nonius Kappa CCD diffractometer using a graphite monochromator with MoK α radiation ($\lambda = 0.71073\text{\AA}$). A total of 309 frames of data were collected using ω -scans with a scan range of 1° and a counting time of 39 seconds per frame. The data were collected at -120 °C using a Oxford Cryostream low temperature device. Details of crystal data, data collection and structure refinement are listed in Table 1. Data reduction were performed using DENZO-SMN.¹ The structure was solved by direct methods using SIR92² and refined by full-matrix least-squares on F² with anisotropic displacement parameters for the non-H atoms using SHELXL-97.³ The hydrogen atom positions were located in a ΔF map and refined with isotropic displacement parameters. The function, $\Sigma w(|F_o|^2 - |F_c|^2)^2$, was minimized, where $w = 1/[(\sigma(F_o))^2 + (0.0472*P)^2 + (0.1494*P)]$ and $P = (|F_o|^2 + 2|F_c|^2)/3$. $R_w(F^2)$ refined to 0.100, with $R(F)$ equal to 0.0386 and a goodness of fit, S , = 1.033. Definitions used for calculating $R(F)$, $R_w(F^2)$ and the goodness of fit, S , are given below.⁴ The data were corrected for secondary extinction effects. The correction takes the form: $F_{corr} = kF_c/[1 + (2.7(5)\times 10^{-5}) * F_c^2 \lambda^3 / (\sin 2\theta)]^{0.25}$ where k is the overall scale factor. Neutral atom scattering factors and values used to calculate the linear absorption coefficient are from the International Tables for X-ray Crystallography (1992).⁵ All figures were generated using SHELXTL/PC.⁶ Tables of positional and thermal parameters, bond lengths and angles, figures and lists of observed and calculated structure factors are located in tables 1 through 6.

Figure 1. View of $\text{Co}(\text{dpm})_2$ showing the atom labeling scheme. Thermal ellipsoids are scaled to the 50% probability level. The Co atom lies on a crystallographic four-fold inversion center at $1/2, 3/4, 5/8$.

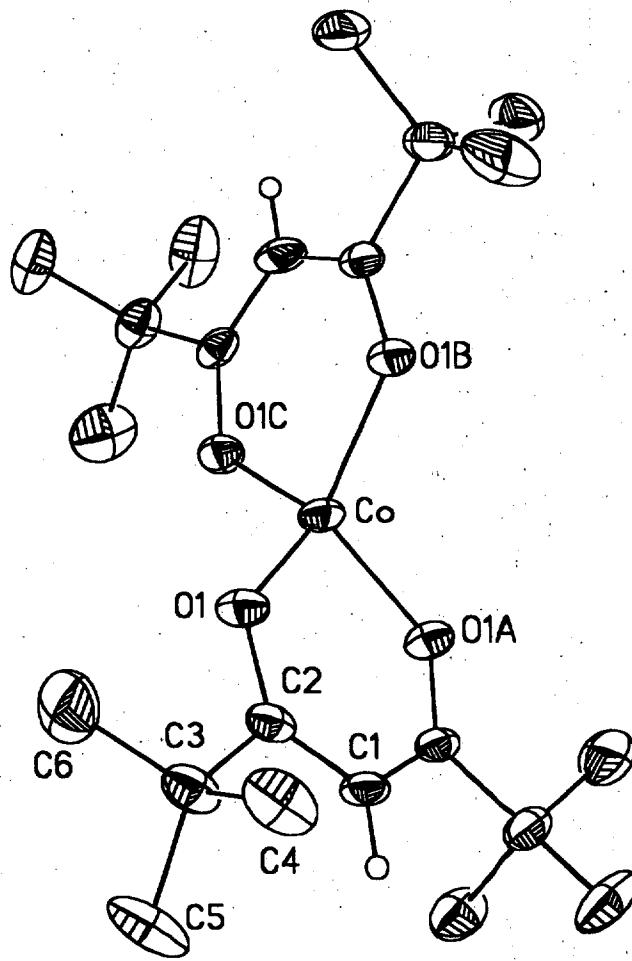

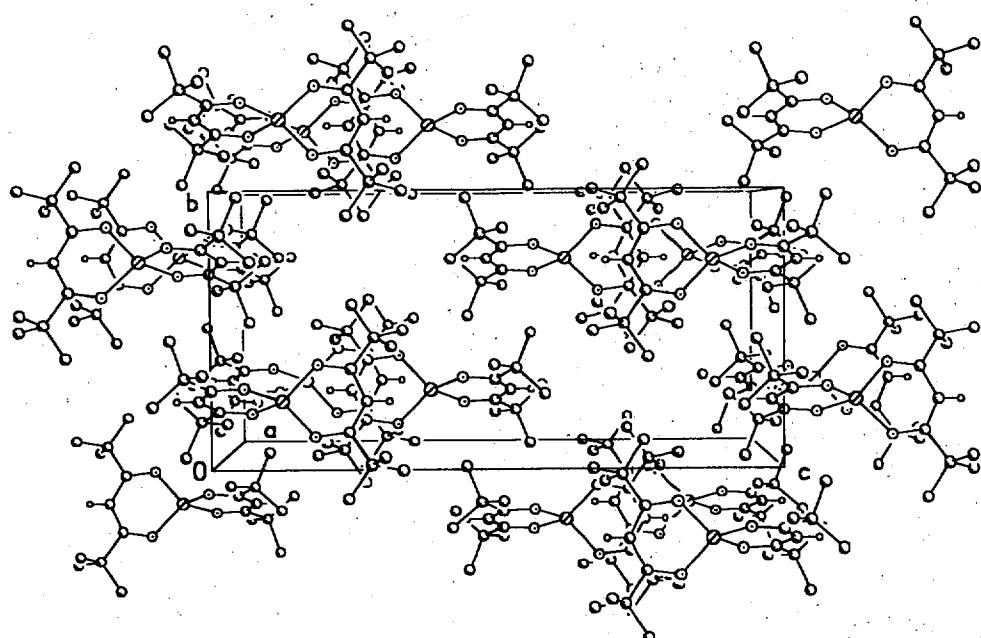

Figure 2. Unit cell packing diagram for $\text{Co}(\text{dpm})_2$. The view is approximately down the a axis.

Neutron structure determination of C₁₃H₁₅D₁O₂ (1b) at 20 K. Neutron diffraction data were collected from a single crystal of (1b) (26.2 mg, 3.9 × 3.2 × 1.7 mm³) at the Intense Pulsed Neutron Source (IPNS), Argonne National Laboratory. The single-crystal diffractometer (SCD) is a time-of-flight (TOF) instrument with a time- and position-sensitive detector. Neutrons were produced by the pulsed (30 Hz) spallation source at IPNS, and the SCD instrument used the entire thermal spectrum of neutrons from each pulse. The SCD position-sensitive neutron detector contained a ⁶Li glass scintillator with dimensions of 30 × 30 cm². For a given crystal setting, data were stored in a three-dimensional histogram in which each point had coordinates *x*, *y*, and *t*. These quantities were the horizontal and vertical detector positions and the TOF, respectively. *t* is related to the neutron wavelength λ by the de Broglie equation $\lambda = (h/m)(t/l)$, in which *h* is Planck's constant, *m* is the neutron mass, and *l* is the path length traversed in time *t*. There were 120 time-of-flight channels in each histogram, constructed in such a way that $\Delta t/t$ had a constant value of 0.015. Each histogram comprised measurements of a three-dimensional block of reciprocal space, from neutrons in the wavelength range of 0.71–4.2 Å. A detailed description of the SCD instrument and data collection and analysis procedures has been published.^{1,2} The sample temperature is controlled at 20 K by a Displex® closed-cycle helium refrigerator (Air Products and Chemicals, Inc., Model CS-202).

An auto-indexing algorithm³ was used to obtain an initial orientation matrix from the peaks in one histogram. For intensity data collection, a total of 25 histograms were measured - each for a different crystal setting - in order to cover a quartet of reciprocal space. Bragg peaks were integrated in three dimensions about their predicted locations and were corrected for the incident neutron spectrum, detector efficiency, and dead-time loss. Lorenz and absorption corrections were also applied. Non-hydrogen atomic coordinates from X-ray analysis was used as starting solution for the neutron structure. The GSAS software package⁴ was used for structural analysis. The refinement was based on *F* using 2966 reflections with $|F_o| > 2\sigma(F_o)$ and a minimum *d* spacing of 0.65 Å. Weights were assigned as $wF_o = (1/(\sigma(F_o)^2 + (0.002 F_o^2)^2))^2$ where $\sigma^2(F_o^2)$ is the variance based on counting statistics. Hydrogen atoms at β-position of 1b, namely H(3A) and H(3B), were refined as fully occupied at the beginning, which gave a high residual *R*

values of $Rw(F) = 0.135$ and $R(F) = 0.094$. In addition, the thermal parameters for these two hydrogen atoms were 10 times greater than those of hydrogen atoms in the adjacent positions. Subsequent refinement has deuterium atoms included at β -position, with the total occupancy of each site being constraint to unity. The refinement used 307 variables and converged successfully to $Rw(F) = 0.088$ and $R(F) = 0.071$. All atoms were refined with anisotropic atomic displacement parameters at the final stage. Here we are able to distinguish hydrogen from deuterium easily because the neutron scattering lengths of hydrogen and deuterium are significantly different (-3.739 for H and +6.671 for D).

A summary of parameters related to the neutron diffraction analysis is presented in Table 1. Selected bond distances and angles are listed in Table 2. Table 3 lists the site occupancies of H and D atoms at the β -position. The ratio of hydrogen to deuterium at the β -position with respect to the carbonyl is found to be 0.976(9) from neutron diffraction data, corresponding to 1.012(9) deuterium being incorporated into the product. Neutron structural analysis also shows that the product is a mixture of stereo isomers with 52% of the deuterium up and 48% down. A plot of the molecules of **1b** is shown in Figure 1.
