Experimental

NMR spectra were obtained either on an IBM AF-200 or AF-300 spectrometer in acetone- d_6 (1H at 200 MHz, and ^{13}C at 50 MHz) using acetone- d_5 as an internal standard (2.06 ppm) unless otherwise noted. $^1H - ^{13}C$ HETCOR spectra were obtained on the AF-300 for **9c** and **12c**. Chemical shifts are reported in ppm, couplings in Hz. Infrared spectra were measured as neat films on a Perkin-Elmer 1600 Series FTIR. Analytical gas chromatography (GC) was performed on a Hewlett-Packard 5890 gas chromatograph equipped with both flame ionization and thermal conductivity. Stationary phases were either Carbowax 6000 or Carbowax 80/120. THF was distilled from Na prior to use. Preparative GC was performed using a Gow-Mac Model 550 GC, with 20% Carbowax 20M columns. Pentane and HMPA were distilled from CaH_2 prior to use. Other reagents were used as received. All reactions were run under nitrogen. Products were purified by flash chromatography on silica gel, neutral alumina or florisil with eluents as noted.

Flash vacuum pyrolysis (FVP) was carried out between 520° C and 580° C at 0.5 torr using a horizontal quartz pyrolysis tube. The reactant was subjected to four freeze-pump-thaw cycles prior to pyrolysis. The pyrolysate was trapped in a cold finger in a dry ice/ether bath at -100° C. The cold finger was warmed to room temperature and the pyrolysate was taken up in 0.5 mL pentane for GC analysis. The isomeric hexadiene products were identified by comparison to commercial samples whose structure and purity were confirmed by 1H NMR.

Multi-photon Infrared (MPIR) Photolysis/Thermolysis. All of the MPIR experiments were performed using a Lumonics 840 Series infrared laser. This is a transversely excited, atmospheric pressure (TEA) carbon dioxide pulsed laser. The pulse has a 200 ns peak with a low energy tail lasting approximately 4 μs . The output is tunable to a variety of carbon dioxide rotational bands

from approximately 900 cm^{-1} to 1100 cm^{-1} , with a pulse energy of up to 50 J. The output wavelength was calibrated to the rotational spectrum of carbon dioxide. The pulse power was measured with a Scientech Model 380102 power transducer which also served as a beam stop. The laser pulse was focused through a ZnSe lens (converging, 30.5 cm focal length) at the center of an 11 cm long, 2 cm diameter gas cell with NaCl windows epoxied in place. The cell was charged with **2** using standard vacuum manifold techniques. The cell was transferred from the laser to the IR spectrometer for IR analysis. The product was recovered for GC analysis as described above for FVP.

Preparation of 3-Methyl-4-thianone

A solution of 80 mL of anhydrous THF and 56.11 mL of 2M LDA in THF (112.0 mmol) was cooled to -78°C . A solution of 4-thianone (**8**, 10.0 g, 86.1 mmol), HMPA (20 g, 112 mmol) and 100 mL of dry THF were added dropwise over 1 hr. The solution was allowed to stir for 20 minutes at -78°C , then methyl iodide (24.0 g, 169 mmol) in 60 mL of THF was added dropwise over 1 hr. This solution was stirred for 2 hr. at -78°C and then allowed to warm to room temperature and quenched with 100 mL of saturated NH_4Cl . The organic layer was washed twice with 100 mL saturated NH_4Cl , once with 100 mL pH = 7.00 buffer and dried over anhydrous MgSO_4 /celite/charcoal for 24 hr. This solution was then filtered, concentrated in vacuo and chromatographed on silica gel using 85:15 pentane:acetone yielding 6.8 g (52.2 mmol, 60.71%) of 3-methyl-4-thianone, as a clear, colorless oil.

Searches of the Cambridge Structural Database.

The substructure **13** was searched against the Cambridge Structural Database. The only constraints were that C2 and C4 were required to have four bonds and the C2-C3 bond could be either double or aromatic. The structures obtained were then grouped as described in the text, into **13**, **14**, **15**, and **16**. The CSD refcodes and the corresponding distances, angles and dihedral angles are recorded in Table S1, along with the averages for each item. Individual references for these structures can be located through the CSD. The average angles are presented below.
