${ }^{\text {a }}$ Only the lowest energy conformer is listed for each ring type; QM refers to HF/6-31G * ${ }^{*}$. ${ }^{\text {b }}$ The headings $\Delta \mathrm{E} / \mathrm{OAc} / \mathrm{Et}$ refer to relative energy in $\mathrm{kcal} / \mathrm{mol}$, then orientations of the acetate and ethyl groups are given as the dihedral angles $\mathrm{C}(3)-\mathrm{C}(4)-\mathrm{O}-\mathrm{C}(=\mathrm{O})$ and $\mathrm{C}(5)-\mathrm{C}(6)-\mathrm{CH}_{2}-\mathrm{CH}_{3}$, respectively. ${ }^{\text {c }}$ The lactone ring dihedral angles are defined as $\tau 1=\mathrm{O}(1)-\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{C}(4)$, etc. and refer to the QM conformer when this is available, otherwise to the MM2* (for $9{ }^{3} \mathrm{~S}_{1}$ to the MMFF) conformer.

## Experimental

Compound 1 (commercially available) was prepared (75\%) as described ${ }^{64}$ but using EtOH instead of EtOAc to obtain a higher solubility. Compounds $\mathbf{2}^{4 \mathrm{~b}}, \mathbf{5}^{4 \mathrm{~b}}$ and $\mathbf{1 3}^{4 \mathrm{a}}$ were previously prepared. Catalytic hydrogenations are described below.

The stereochemical purities of the hydrogenation products were determined by fused silica capillary column GLC using DB-225, SE-52 and Carbowax 20 M columns mounted in a HewlettPackard 5830 A gas chromatograph (FID detector, electronic integration) using $\mathrm{H}_{2}$ as carrier gas. To find the retention times of the minute amounts of minor isomers formed we used reference mixtures. Compounds 1,2 and $\mathbf{1 3}$ were reduced with ammonia borane to give $\beta$-hydroxy lactones as previously described for $1 .{ }^{11}$ This reduction method gave rather low stereoselectivities ( 66,44 and $81 \%$ respectively) and is thus useful for making reference mixtures containing all possible stereoisomers. The mixtures of isomeric $\beta$-hydroxy lactones were converted to acetates and MEM ethers and these were analyzed by GLC. All diastereomers separated well, even the four isomers obtained from 2 (in the product ratios $30: 44: 8: 18$ ). NMR spectra of the crude product mixtures were compatible with the high stereochemical purities found by GLC.

Separations on silica gel were performed using Kieselgel 60 (Merck, 70-230 mesh). ${ }^{1} \mathrm{H}$ NMR spectra were recorded at 270 MHz on a JEOL GSX 270 spectrometer or at 400 MHz on a Varian Mercury spectrometer. ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 100 MHz using a Varian Mercury spectrometer. The NMR solvent was $\mathrm{CDCl}_{3}$; tetramethylsilane was used as internal reference. Coupling constants $(J)$ are given in Hz. HR-FAB mass spectra were measured using a JEOL JMS SX/SX102A instrument (direct inlet).
X-ray structural data were downloaded from the CSD database ${ }^{65}$ and dihedral angles were then extracted using the Windows-based program DIAMOND ${ }^{66}$.

Computational work. Conformations of the saturated lactones 9,11 , and 17 and unsaturated lactones $\mathbf{3}, \mathbf{5}$, and $\mathbf{1 4}$ were found by exploring the conformational space using a Monte Carlo Multiple Minimum (MCMM) search in which new structures were generated by random changes
in torsional angles, followed by an energy minimization using the truncated Newton conjugategradient method. ${ }^{67}$ The MM3* force field of Macromodel $7.0^{67}$ was used in the MCMM search of the lactones $\mathbf{3}, \mathbf{5}$, and $\mathbf{1 4}$. The obtained conformers were used as starting geometries for HF/631G* ab initio geometry optimizations performed in the MacSpartan Pro ${ }^{68}$ program. The results are presented in Table B.

The MM2*, MM3* and MMFF force fields of Macromodel 7.0 were employed in three separate MCMM searches of each of the saturated lactones $\mathbf{9}, \mathbf{1 1}$, and $\mathbf{1 7}$. Conformers with a relative energy exceeding $+3.0 \mathrm{kcal} / \mathrm{mol}$ were discarded. For each compound the three sets of low energy conformers were used as starting geometries for HF/6-31G* optimizations performed in the Jaguar program. ${ }^{69}$ Duplicates were removed and the energy exclusion limit was again applied. This led to the results in Table C.

Conformations reported in Table 3 were generally obtained by QM optimization of input structures obtained by axial or equatorial substitution in ring types ${ }^{4} \mathrm{H}_{5}, \mathrm{~B}_{3,6},{ }^{1} \mathrm{~S}_{3}-\mathrm{B}_{3,6}$ and ${ }^{2} \mathrm{~S}_{6}-\mathrm{B}_{3,6}$. The ab initio HF/6-31G* optimizations were performed with the MacSpartan Pro program using default settings and the convergence criterion keyword TOLG=0.00001.

The other ab initio HF/6-31G* optimizations, i.e. torsional drivers (Figures 4 and 5), were performed with the Jaguar 4.2 program using default settings and the ultrafine grid accuracy.

Transition states were verified to have a hessian yielding a single imaginary frequency and the transition vibrational mode was animated and visually inspected.
Boltzmann-averaged coupling constants were calculated using the extended Karplus equation ${ }^{70}$ implemented in Macromodel 7.0.

4-Acetoxy-6-methyl-1-oxa-3-cyclohexen-2-one (3) was prepared as described for $\mathbf{5}^{4 \mathrm{~b}}$ using acetyl chloride and $N$-ethyldiisopropylamine and was obtained as an oil; yield $>95 \%$; ${ }^{1} \mathrm{H}$ NMR: $\delta$ 5.92 (dd, $1 \mathrm{H}, J 2.2$ and 1.0, H-3), 4.63 (ddq, $1 \mathrm{H}, J 11.2,4.2,6.4, \mathrm{H}-6$ ), 2.64 (ddd, $1 \mathrm{H}, J 17.6$, 11.2, 2.2, H-5 $\beta$ ), 2.49 (ddd, 1 H, J 17.6, 4.2, 1.0, H-5 $)$, 2.24 (s, 3 H, OAc), 1.47 (d, $3 \mathrm{H}, J 6.4$, $\mathrm{CHCH}_{3}$ ).

6-methyl-4-[(2-methoxyethoxy)methoxy]-1-oxa-3-cyclohexen-2-one (4). The tetrabutylammonium salt of $\mathbf{1}(4 \mathrm{mmol})$ was extracted from water $(60 \mathrm{~mL})$ into dichloromethane ( $3 \times 150 \mathrm{~mL}$ ). After concentration and drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}(40 \mathrm{mmol})$ and $\mathrm{MEMCl}(6 \mathrm{mmol})$ were added to the solution $(15 \mathrm{~mL})$ of the tetrabutylammonium salt and the compounds were allowed to react for 15 min . The mixture was filtered, the solvent evaporated and the residue partitioned between $\mathrm{Et}_{2} \mathrm{O}$ and dilute aqueous $\mathrm{NaHCO}_{3}$. After three additional extractions with $\mathrm{Et}_{2} \mathrm{O}$ the extracts were combined and the solvent was evaporated. Dichloromethane was added. After drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentration, 4 was obtained in a purity of ca. $90 \%$; the major contaminant was 2 -methoxyethanol. The crude product was purified on a silica gel column to give 4 in a $73 \%$ yield; ${ }^{1} \mathrm{H}$ NMR: $\delta 5.33(1 \mathrm{H}$, three equal intensity resonances with spacings $c a .0 .6$ and $1.0 \mathrm{~Hz}, \mathrm{H}-3), 5.20\left(1 \mathrm{H}, J 6.4, \mathrm{OCH}_{2} \mathrm{O}\right), 5.17(1 \mathrm{H}, J 6.4$, $\mathrm{OCH}_{2} \mathrm{O}$ ), 4.55 (ddq, $\left.1 \mathrm{H}, J 11.2,4.6,6.3, \mathrm{H}-6\right), 3.79\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right), 3.56(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}$ ), $3.39\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 2.47(\mathrm{ddd}, 1 \mathrm{H}, J 17.2,11.2,1.3, \mathrm{H}-5 \beta$ ), 2.36 (dd, $1 \mathrm{H}, J 17.2$, 4.4, $\mathrm{H}-5 \alpha$ ), $1.44\left(\mathrm{~d}, 3 \mathrm{H}, \mathrm{J} 6.3, \mathrm{CHCH}_{3}\right)$.

3,6-dimethyl-4-[(2-methoxyethoxy)methoxy]-1-oxa-3-cyclohexen-2-one (6). A solution of 2 $(1 \mathrm{mmol})$ in acetonitrile $(5 \mathrm{~mL})$ was added to a stirred suspension of sodium hydride $(1.45 \mathrm{mmol}$, freed from stabilizing mineral oil) in acetonitrile ( 3 mL ). Hydrogen was evolved and a light gray precipitate was formed. A solution of $\mathrm{MEM-Cl}(1.2 \mathrm{mmol})$ in acetonitrile was added. After 25 min the reaction mixture was acidified with acetic acid ( 1 mmol ) and the solvent evaporated. The residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$ and saturated aq. $\mathrm{NaHCO}_{3}(10 \mathrm{mmol})$. $\mathrm{The}^{\mathrm{Et}} \mathrm{Et}_{2} \mathrm{O}$ phase was separated, the solvent was evaporated and dichloromethane added. Drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, evaporation of the solvent and purification on silica gel gave 6 in a $62 \%$ yield. ${ }^{1} \mathrm{H}$ NMR: $\delta 5.18$ (s, $2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}$ ), 4.47 (ddq, $\left.1 \mathrm{H}, J 11.7,4.0,6.2, \mathrm{H}-6\right), 3.79\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right), 3.55(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}$ ), $3.38\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 2.69(\mathrm{ddq}, 1 \mathrm{H}, J 17.2,4.0,1.1, \mathrm{H}-5 \alpha), 2.52$ (ddd, $1 \mathrm{H}, J 17.2$, $11.7,2.2, \mathrm{H}-5 \beta), 1.82\left(\mathrm{dd}, 3 \mathrm{H}, J 2.2,1.1, \mathrm{C}(3)-\mathrm{CH}_{3}\right), 1.44\left(\mathrm{~d}, 3 \mathrm{H}, J 6.2, \mathrm{CHCH}_{3}\right)$.
cis-4-Acetoxy-6-methyl-1-oxacyclohexan-2-one (9) and trans-4-Acetoxy-6-methyl-1-oxacyclohexan-2-one were prepared as a mixture of cis and trans isomers from a mixture of the corresponding alcohols ${ }^{11}$ (cis-7/trans-7, ca. 3:1). Cis acetate (9): ${ }^{1} \mathrm{H}$ NMR data are given in Table A. ${ }^{13}$ C NMR: $\delta 170.1,169.7,73.0,66.0,36.2,35.6,21.1,21.0$. Trans acetate: ${ }^{1} \mathrm{H}$ NMR: $\delta 5.25$ (dq, 1 H, J 5.2, 3.6, H-4), 4.72 (ddq, 1 H, J 11.3, 2.9, 6.4, H-6), 2.78 (dd, 1 H, J 18.2, 5.2, H-3),
2.70 (ddd, $1 \mathrm{H}, J 18.0,3.5,1.7, \mathrm{H}-3)$, ca. $2.10(1 \mathrm{H}$, partly obscured by OAc, H-5- $\alpha$ ), 2.08 ( $\mathrm{s}, 3$ $\mathrm{H}, \mathrm{OAc}), 1.78$ (ddd, $1 \mathrm{H}, J 14.8,11.4,3.4, \mathrm{H}-5-\beta), 1.42\left(\mathrm{~d}, 3 \mathrm{H}, J 6.7, \mathrm{C}(6)-\mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}$ NMR: $\delta$ $170.0,169.1,72.6,65.7,35.1,34.5,21.3,21.0$. The $90 \mathrm{MHz}^{1} \mathrm{H}$ NMR data in the literature ${ }^{72}$ show moderate agreement with ours.
trans-4-Acetoxy-6-ethyl-5-methyl-1-oxa-3-cyclohexen-2-one (14) was prepared in the same way as 3 and was obtained as an oil; yield $>95 \%$; ${ }^{1} \mathrm{H}$ NMR: $\delta 5.93$ (d, $1 \mathrm{H}, J 1.3, \mathrm{H}-3$ ), 4.12 (q, 1 H, J 6.4, H-6), 2.69 (d of pentet, $1 \mathrm{H}, J 1.3,7.0, \mathrm{H}-5$ ), 2.25 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OAc}$ ), 1.81 (dq, $2 \mathrm{H}, J 6.1$ and $\left.7.4, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) 1.19\left(\mathrm{~d}, 3 \mathrm{H}, J 7.1, \mathrm{C}(5)-\mathrm{CH}_{3}\right) 1.05\left(\mathrm{t}, 3 \mathrm{H}, J 7.4, \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$.
trans-6-ethyl-5-methyl-4-[(2-methoxyethoxy)methoxy]-1-oxa-3-cyclohexen-2-one (15) was prepared by the method used for 4 . The crude product was purified on a silica gel column to give 15 in a $94 \%$ yield; ${ }^{1} \mathrm{H}$ NMR: $\delta 5.28$ ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-3$ ), 5.18 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}$ ), 4.04 (q, $1 \mathrm{H}, J 6.4, \mathrm{H}-6$ ), 3.80-3.76 (m, $2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}$ ), 3.59-3.54 (m, $2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}$ ), $3.39\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 2.51$ (pentet, $1 \mathrm{H}, J 7.1, \mathrm{H}-5$ ), 1.76 (pentet-like, $2 \mathrm{H}, J 7.1, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 1.21 (d, $\left.3 \mathrm{H}, J 7.0, \mathrm{C}(5)-\mathrm{CH}_{3}\right)$, $1.04\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{J} 7.4, \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$.

Hydrogenation of 1, 2 and 13. All catalytic hydrogenations were run at $20-22{ }^{\circ} \mathrm{C}$. Conditions in hydrogenations using W2 Raney-Ni: for 1, $\mathrm{EtOH}, 5 \mathrm{~atm} \mathrm{H}_{2}, 3$ days; for 2, THF, 30 atm $\mathrm{H}_{2}, 2$ days; for 13, EtOAc, $5 \mathrm{~atm} \mathrm{H}_{2}, 17 \mathrm{~h}$. For hydrogenations of $\mathbf{1 , 2}$ and $\mathbf{1 3}$ using $\mathrm{PtO}_{2}$ (Adams' catalyst): $5 \mathrm{~atm} \mathrm{H}_{2}$, EtOAc, Parr apparatus, 20 h .

Hydrogenation of enol acetates and enol MEM ethers. Diethyl ether was used as solvent; $20-22^{\circ} \mathrm{C}$; catalysts were $10 \% \mathrm{Pd} / \mathrm{C}$ (Fluka, batch number 258624785; 0.04-0.09 equiv. Pd for the enol acetates and 0.09-0.32 equiv. for the enol MEM ethers; see also next paragraph) or $5 \%$ Rh/C (Merck-Schuchardt, batch number 1175926). For 5 and 6 a 5 atm pressure was applied (Parr apparatus); the other enol acetates and enol MEM ethers were reduced at 1 atm pressure. The reaction mixtures obtained from the enol acetates contained acetic acid which was removed by washing first with a minimum amount of conc. aq. $\mathrm{NaHCO}_{3}$ and then with a little brine. After drying $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtration and concentration the product mixtures were analysed by GLC and ${ }^{1} \mathrm{H}$ NMR spectroscopy. All stereoselectivities are presented in Table 1. The saturated acetates or MEM ethers were separated from the hydrogenolysis products using silica gel columns and were thus obtained in $>95 \%$ purity ( ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR) as colorless oils.

The hydrogenation of $\mathbf{3}(305 \mathrm{mg})$ in $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$ was carried out using $10 \% \mathrm{Pd} / \mathrm{C}$ from another supplier ( 80 mg , Merck, batch no. 34627). After filtration and evaporation of the solvent the crude product was carefully analyzed by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR at 400 and 100 MHz respectively. The ratio of cis-9 to trans-9 was $>99 /<1$. The yield of the byproduct formed by hydrogenolysis was ca. $20-22 \%$, which is less than with the other catalyst.
cis-4-Acetoxy-6-methyl-1-oxacyclohexan-2-one (9), $40 \%$ yield; indistinguishable ( ${ }^{1} \mathrm{H}$ NMR, GLC) from the acetate prepared by acetylation of 7 (cis). ${ }^{1} \mathrm{H}$ NMR data are given in Table $\mathrm{A} .{ }^{13} \mathrm{C}$ NMR data are presented above.
cis-4-[(2-Methoxyethoxy)methoxy]-6-methyl-1-oxacyclohexan-2-one (10), 81\% yield; indistinguishable ( ${ }^{1} \mathrm{H}$ NMR, GLC) from the MEM ether prepared from $7 .{ }^{1} \mathrm{H}$ NMR data are given in Table A.
all-cis-4-Acetoxy-3,6-dimethyl-1-oxacyclohexan-2-one (11), $40 \%$ yield; ${ }^{1} \mathrm{H}$ NMR data are given in Table A; ${ }^{13} \mathrm{C}$ NMR: $\delta 173.3,170.4,71.8,69.7,37.6,37.5,20.9,20.8,11.0$. FAB MS: $m / z 187\left(\mathrm{M}+\mathrm{H}^{+}\right), 127\left(\mathrm{M}+\mathrm{H}^{+}-\mathrm{HOAc}\right)$; HR-FAB MS: $m / z$ 187.0965; calc. for $\mathrm{C}_{9} \mathrm{H}_{15} \mathrm{O}_{4}: 187.0971$.
all-cis-4-[(2-Methoxyethoxy)methoxy]-3,6-dimethyl-1-oxacyclohexan-2-one (12), 88\% yield; ${ }^{1} \mathrm{H}$ NMR data are given in Table A; ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, two signals coincide): $\delta 174.0,94.1$, $72.2,71.7,67.3,59.1,39.0,36.8,21.2,11.5 ;{ }^{13} \mathrm{C}$ NMR in acetone- $\mathrm{d}_{6}: \delta 174.0,94.8,73.5,72.5$, $72.3,67.9,58.8,39.3,38.0,21.3,11.9$. FAB MS: $m / z 255\left(\mathrm{M}+\mathrm{Na}^{+}\right), 233\left(\mathrm{M}+\mathrm{H}^{+}\right), 218\left(\mathrm{M}+\mathrm{H}^{+}-\right.$ $\mathrm{CH}_{3}$ ), 217; HR-FAB MS: $m / z$ 233.1404; calc. for $\mathrm{C}_{11} \mathrm{H}_{21} \mathrm{O}_{5}: 233.1389$.
r-4-Acetoxy-c-6-ethyl-t-5-methyl-1-oxacyclohexan-2-one (17), $48 \%$ yield; ${ }^{1} \mathrm{H}$ NMR data are given in Table A; ${ }^{13} \mathrm{C}$ NMR: $\delta 170.3,169.9,82.8,71.8,38.0,35.4,25.7,21.0,14.2,8.8$. FAB MS: $m / z 201\left(\mathrm{M}+\mathrm{H}^{+}\right), 141\left(\mathrm{M}+\mathrm{H}^{+}-\mathrm{HOAc}\right) ;$ HR-FAB MS: $m / z$ 201.1128; calc. for $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{O}_{4}$ : 201.1127.
c-6-Ethyl-r-4-[(2-methoxyethoxy)methoxy]-t-5-methyl-1-oxacyclohexan-2-one (18), 95\% yield; ${ }^{1} \mathrm{H}$ NMR data are given in Table $\mathrm{A} ;{ }^{13} \mathrm{C}$ NMR: $\delta 169.9,93.6,82.1,74.5,70.6,66.3,58.0$, 37.9, 35.3, 24.8, 13.4, 7.8. FAB MS: $m / z 269\left(\mathrm{M}+\mathrm{Na}^{+}\right), 247\left(\mathrm{M}+\mathrm{H}^{+}\right), 141\left(\mathrm{M}+\mathrm{H}^{+}-\right.$ $\mathrm{HOCH}_{2} \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{OCH}_{3}$ ); HR-FAB MS: $m / z$ 247.1533; calc. for $\mathrm{C}_{12} \mathrm{H}_{23} \mathrm{O}_{5}$ : 247.1546.
