## Experimental Details

General Remarks. ${ }^{1} \mathrm{H}(200 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(50.29 \mathrm{MHz})$ NMR spectra were recorded on a Varian VXR-200 spectrometer, or ${ }^{1} \mathrm{H}(270 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(67.94 \mathrm{MHz})$ NMR spectra were recorded on a JEOL EX- 270 spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts are referenced to internal benzene- $\mathrm{d}_{6}\left({ }^{1} \mathrm{H} \delta\right.$ 7.200 ppm and ${ }^{13} \mathrm{C} \delta 128.00 \mathrm{ppm}$ ) or $\mathrm{CDCl}_{3}\left({ }^{13} \mathrm{C} \delta 77.00 \mathrm{ppm}\right)$. Mass spectra were measured at 70 eV on a JEOL JMS-DX300 mass spectrometer equipped with a JMA-3500 data processing system. Melting points were measured with a Yanaco-MP-S3 apparatus and were uncorrected. The elemental analyses were performed at the Microanalysis Division of Institute for Chemical Research, Kyoto University: Analytical samples were purified by preparative GLC, preparative HPLC, or recycling reverse-phase liquid chromatography. Analytical and preparative GLC were performed on a Shimadzu GC-4B gas chromatography, equipped with a $3-\mathrm{m}$ or 1 -m column packed with $30 \%$ Silicone DC550 on Celite 545. Recycling reverse-phase liquid chromatography was performed with JAI LC-908 equipped with JAIGEL-ODS S-343-15 and P-15 columns. Reverse-phase column chromatography was performed by using Wakogel LP-40C18 (20-40 $\mu \mathrm{m}$ ) (Wako Pure Chemical Industries). Reverse-phase thin layer chromatography was performed on plates of RP-18 F254S (Merck). Column chromatography was performed by using Kieselgel 60 (70-230 mesh) (Merck). Thin layer chromatography was performed on plates of silica gel 60F-254 (Merck).

Trimethylchlorostannane was prepared by disproportionation between tetramethylstannane and dimethyldichlorostannane (Grant, D.; Wazer, J. R. J. Organomet. Chem. 1965, 4, 229): the last was kindly donated from Nitto Kasei Co.. Diphenyldichlorosilane was kindly donated from Shin-Etsu Chemical Co., Ltd.. Diphenylchlorosilane and silicon tetrachloride were purchased from Shin-Etsu Chemical Co., Ltd.. Trimethylchlorosilane was treated with small pieces of sodium under a nitrogen
atmosphere to remove the dissolved HCl and the supernatant was used. $n$-Butyllithium in hexane, tertbutyllithium in pentane, and granular lithium were purchased from Wako Pure Chemical Industries, Kanto Chemical Co., Inc., and Chemetall Gesellshaft, respectively. 4-(Dimethylamino)pyridine (DMAP) was purchased from Nacalai Tesque and used without purification. 12-crown-4 was purchased from Aldrich and dried over Molecular Sieves 3A before use. 2-Methyl-3-buten-2-ol and 1-octen-3-ol were purchased from Tokyo Chemical Industry. Spray-dried KF was purchased from Wako Pure Chemical Industries. THF and $\mathrm{Et}_{2} \mathrm{O}$ were distilled under a nitrogen atmosphere from sodium benzophenone ketyl. Dichloromethane, triethylamine, and carbon tetrachloride were distilled from calcium hydride. All reactions were carried out under an argon atmosphere.

Preparation of Alcohols. 3,4-Dimethyl-1-penten-3-ol was obtained by reaction of 3-methyl-2-butanone with vinylmagnesium bromide in THF in $54 \%$ yield. 3,4,4-Trimethyl-1-penten-3-ol was obtained by reaction of 3,3-dimethyl-2-butanone with vinylmagnesium bromide in THF in $56 \%$ yield. 3-Phenyl-1-buten-3-ol was prepared by reaction of acetophenone with vinylmagnesium bromide in THF in $90 \%$ crude yield. This compound was decomposed by distillation, so that it was used in the next step without purification. 1-Vinyl-cyclohexanol was obtained by reaction of cyclohexanone with vinylmagnesium bromide in THF in $86 \%$ yield. 1-Propenyl-cyclohexanol was obtained by reaction of cyclohexanone with 1-propenylmagnesium bromide in THF in $25 \%$ yield as a $1: 1$ mixture of $E$ and $Z$ isomers. 1-(2'-Methyl-1'-propenyl)-cyclohexanol was obtained by reaction of cyclohexanone with 2-methyl-propenylmagnesium bromide in THF in only $14 \%$ yield, which was due to the poor separation by column chromatography on silica gel. 1-Methyl-1-(1'-cyclohexenyl)-ethanol was obtained by reaction of methyl 1-cyclohexene-1-carboxylate with methyllithium in $\mathrm{Et}_{2} \mathrm{O}$ in $81 \%$ yield. 1-Vinyl-2-cyclohexenol was obtained by reaction of 2-cyclohexene-1-one with vinyllithium in $\mathrm{Et}_{2} \mathrm{O}$ in $74 \%$ yield. 3-Ethyl-1-penten-3-ol was obtained by reaction of 3-pentanone with vinylmagnesium bromide in THF in $54 \%$ yield.

## Crossover Experiments

The intramolecular fashion of the rearrangement was confirmed by the following crossover experiment. An equimolar mixture of (allyloxysilyl)stannanes $\mathbf{1}$ and 24 was treated with $n$-butyllithium (4 equiv) under the same condition employed for 1 to give only the intramolecular rearrangement products 5 and $\mathbf{2 5}$ in $81 \%$ and $82 \%$ yields, respectively. No cross-over products $\mathbf{2 6}$ and 27 were detected at all.

[(3-Ethyl-1-penten-3-oxy)di(p-tolyl)silyl]trimethylstannane (24). (1) $\operatorname{Di}(p$ tolyl)dichlorosilane was prepared by reaction of silicon tetrachloride with 2 equiv of ( $p$-tolyl)magnesium bromide in THF-toluene in $85 \%$ yield. (2) (3-Ethyl-1-penten-3-oxy)di(p-tolyl)chlorosilane was prepared from di(p-tolyl)dichlorosilane ( $2.79 \mathrm{~g}, 9.93 \mathrm{mmol}$ ) and 3-ethyl-1-penten-3-ol ( $1.46 \mathrm{~g}, 12.8 \mathrm{mmol}$ ) in the presence of triethylamine ( $1.94 \mathrm{~mL}, 13.9 \mathrm{mmol}$ ) and 4-(dimethylamino) pyridine ( $123 \mathrm{mg}, 0.990 \mathrm{mmol}$ ) in THF ( 12.0 mL ) by essentially the same method as described in the literature. ${ }^{4 \mathrm{c}}$ This compound decomposed during distillation, so that it was used in the next step without purification.
