## Supporting Information

General: All reactions involving organometallic species were carried out under an atmosphere of dry $\mathrm{N}_{2}$ using oven-dried glassware and syringes. All common reagents and solvents were obtained from commercial suppliers and used without further purification unless otherwise indicated. THF and $\mathrm{Et}_{2} \mathrm{O}$ were distilled from sodium benzophenone ketyl under $\mathrm{N}_{2}$ immediately prior to use, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ from $\mathrm{P}_{2} \mathrm{O}_{5}$ and DMF from $\mathrm{CaH}_{2}$. Hexane and EtOAc were distilled before use. Ferrocenecarbaldehyde and all the olefins used were commercially available. Ozone was generated in the usual fashion by a Fischer 500 laboratory ozonator using commercial-grade oxygen as a source. ${ }^{20 a}$ Variable voltage settings ( $80-90 \mathrm{~V}$ ), pressures ( $6-8 \mathrm{lb} / \mathrm{in}^{2}$ ), flow rates ( $0.02-0.03 \mathrm{ft}^{3} / \mathrm{min}$ ) and reaction times ( $15-20 \mathrm{~min}$ ) were employed. The ozonizations were carried out in ordinary schlenks which were nearly filled with solvent and cooled at $-78^{\circ} \mathrm{C}$. Ozone was introduced through a glass tube extended very close to the magnetic stirring bar and tipped with a fritted glass disc. TLC was performed on aluminum-backed plates coated with silica gel 60 with F254 indicator (Scharlau). Flash column chromatography was carried out on silica gel $60,230-240$ mesh. ${ }^{1} \mathrm{H}$ NMR ( $200,300 \mathrm{MHz}$ ) and ${ }^{13} \mathrm{C}$ NMR $(50.5,75.5 \mathrm{MHz})$ spectra were measured on a Bruker AC-200 and AC-300 instruments, respectively, with tetramethylsilane ( $\delta=0.0,{ }^{1} \mathrm{H}$ NMR) or $\mathrm{CDCl}_{3}\left(\delta=77.00,{ }^{13} \mathrm{C}\right.$ NMR) as internal standard. Carbon multiplicities were assigned by DEPT techniques. Low-resolution electron impact mass spectra (EI-LRMS) were obtained at 70 eV on a HP 5987 A instrument, and the intensities are reported as a percentage relative to the base peak after the corresponding $m / z$ value. High-resolution mass spectra (HRMS) were determined on a Finnigan MAT 95 spectrometer. Elemental analysis were carried out on a Perkin-Elmer 2400 microanalyzer.

propenylidene)pentacarbonylchromium (1) To a solution of [(methoxy)(methyl)methylene]pentacarbonylchromium ( $6.3 \mathrm{~g}, 25 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(150 \mathrm{~mL})$ at room temperature were successively added triethylamine ( $13.94 \mathrm{~mL}, 100 \mathrm{mmol}$ ), ferrocenecarbaldehyde ( $6.42 \mathrm{~g}, 30 \mathrm{mmol}$ ) and chlorotrimethylsilane ( $9.52 \mathrm{~mL}, 75 \mathrm{mmol}$ ). The mixture was stirred at room temperature for 48 h . Silica gel (ca. 25 g ) was then added, and the solvent was removed under reduced pressure. The residue was loaded onto a silica gel column under $\mathrm{N}_{2}$. Elution with hexane gave $8.35 \mathrm{~g}(18.72 \mathrm{mmol}, 75 \%)$ of carbene complex 1 as a dark violet solid. General Procedure for the Cyclopropanation Reactions: A mixture of carbene complex 1 or $\mathbf{4}(0.5 \mathrm{mmol})$, the corresponding alkene ( 10 mmol ) and 3,5-di-tert-butyl-4-methylphenol (BHT, $5 \mathrm{mg}, 0.02 \mathrm{mmol}$ ) in DMF ( 20 mL ) was refluxed for a period of $25-35 \mathrm{~min}(1.5 \mathrm{~h}$ in the case of compound 5 and 2-2.5 h for compounds $\mathbf{6 , 8} \mathbf{8}$ and 11). Upon cooling to room temperature the solvent was removed under reduced pressure and the resulting residue was dissolved in hexane and filtered throught a plug of celite. Evaporation of the volatiles and column chromatography (Silica gel) afforded pure compounds $\mathbf{3}, \mathbf{5}-11$. In the case of compounds $\mathbf{3}, \mathbf{5}, \mathbf{7}$ and $\mathbf{1 0}$ the major diastereoisomer was separated by this procedure. Yields are described in

Schemes 2, 3 and Table 1. In the preparation of compound $\mathbf{5}$ when $\mathrm{CH}_{3} \mathrm{CN}$ or THF were used as solvents the reaction was refluxed for 1.5 h and 6 h respectively.
