^aOnly the ψ values consistent with ψ obtained by a combined fit of $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{HN}}$ and $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{C}^*}$ cross-correlation rates are indicated.

^bValues of ψ calculated as described in Materials and Methods.

^cThere are two possible ψ values consistent with the $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{HN}}$ and $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{C}^*}$ cross-correlation rates.

^dFor $-50^\circ \leq \psi \leq 40^\circ$ only a single ψ value is reported (see text and Figure 3b).

^e Γ value close to an extrema in the Γ vs. ψ profile. In this case an error in Γ can result in large errors in ψ , as described in the text. Values of ψ obtained from cross-correlation rates near the extrema are not included. Note that a good agreement between the x-ray derived values and ψ obtained when $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{HN}}$ and $\Gamma_{\text{H}\alpha\text{C}\alpha,\text{C}^*}$ are fit simultaneously is nevertheless obtained.
