## Experimental Procedures and Spectral Data for New Compounds

## General

All reactions were carried out in dried solvents under a nitrogen atmosphere. The NMR mesurments were performed with Varian Gemini-2000 (7.0 T magnet: 300 MHz for ${ }^{1} \mathrm{H}$ NMR; 75.4 MHz for ${ }^{13} \mathrm{C}$ NMR). The proton chemical shifts (ppm) are referenced to internal residual solvent protons ( $\mathrm{CHCl}_{3}$, 7.26) or TMS ( 0.00 ). The carbon chemical shifts are referenced to the carbon signal of the deuterated solvents $\left(\mathrm{CDCl}_{3}, 77.0\right)$.
(E)-5-(Dimethylphenylsilyl)-1-tetrahydropyranyloxy-4-nonene (4a). To a mixture of 2a ( $6.9 \mathrm{~g}, 28 \mathrm{mmol}$ ), triethylamine ( $6 \mathrm{~mL}, 43 \mathrm{mmol}$ ), and 4-(dimethyamino)pyridine ( $71 \mathrm{mg}, 0.58$ mmol) was added 1-chloro-1,1,2-triphenyl-2,2-dimethyldisilane ( $10 \mathrm{~g}, 28 \mathrm{mmol}$ ) at room temperature; the mixture was stirred at room temperature for 12 h . After the completion of the reaction, hexane was added to the mixture and the precipitate formed was filtered off. Distillation under reduced pressure gave $3 \mathrm{a}(14.7 \mathrm{~g}, 93 \%)$. To a mixture of $\mathrm{Pd}(\mathrm{acac})_{2}(123 \mathrm{mg}, 0.40 \mathrm{mmol})$, 1,1,3,3-tetramethylbutyl isonitrile ( $0.53 \mathrm{~mL}, 3.0 \mathrm{mmol}$ ) were added toluene ( 40 mL ) and $\mathbf{3 a}(12.4 \mathrm{~g}$, 22.2 mmol ) successively at room temperature; the mixture was heated under reflux for 1 h . After the volatile material was evaporated under reduced pressure, THF ( 50 mL ) was added to the residue. To the mixture was added $n-\operatorname{BuLi}(1.53 \mathrm{M}$ in hexane, $22 \mathrm{~mL}, 34 \mathrm{mmol})$ dropwise at $0^{\circ} \mathrm{C}$; the mixture was stirred for 20 min at $0^{\circ} \mathrm{C}$. Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ aq was added to the solution, and organic material
was extracted with ether. Column chromatography on silica gel (hexane: ether $=50: 1-1: 1$ ) afforded $\mathbf{4 a}(5.8 \mathrm{~g}, 73 \%) .4 \mathbf{a}$ (a $1: 1$ mixture of the two diastereomers): ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta 0.21(\mathrm{~s}, 3 \mathrm{H})$, $0.23(\mathrm{~s}, 3 \mathrm{H}), 0.79(\mathrm{t}, \mathrm{J}=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 1.02-1.73(\mathrm{~m}, 12 \mathrm{H}), 1.76-1.85(\mathrm{~m}, 1 \mathrm{H}), 3.29-3.38(\mathrm{~m}$, $1 \mathrm{H}), 3.45-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.64-3.73(\mathrm{~m}, 1 \mathrm{H}), 3.82-3.89(\mathrm{~m}, 1 \mathrm{H}), 4.55-4.59(\mathrm{~m}, 1 \mathrm{H}), 5.13-5.28$ (m, 2H), 7.29-7.34 (m, 3H), 7.44-7.48 (m, 2H); IR (neat) 2950, 2920, 1250, 1140, 1120, 1080, $1030 \mathrm{~cm}^{-1}$. ## Procedures for the Determination of the Stereochemistries

Enantiomeric Excess of $(\boldsymbol{S}) \mathbf{- 1 b}$. The enantio-enriched allylsilane $(S) \mathbf{- 1 b}$ was transformed into diol i by stereoselective hydroboration with 9-BBN followed by oxidation with basic hydrogen peroxide. The dicarbamate $\mathbf{i}^{\prime}$, which was prepared by reaction of 3,5 -dinitrophenylisocyanate with $\mathbf{i}$ in the presence of pyridine, was subjected to the HPLC analysis with chiral column Sumichiral OA4000 (hexane: $\mathrm{EDC}: \mathrm{EtOH}=50: 15: 2$ ) (EDC: 1,2-dichloroethane).

Relative Stereochemistry of 5 . The $\mathrm{C}=\mathrm{C}$ bond of 5 was hydrogenated by diimide, generated from tosylhydrazide in the presence of base, to give 2-isopropyl-3-hexyltetrahydrofuran ii in high yield as a single isomer.

The stereochemistry of cis in the five-membered ring was confirmed by transformation to the known compound iii ( ${ }^{1} \mathrm{H}$ NMR). See: Frauenrath, H.; Runsink, J. J. Org. Chem. 1987, 52, 2707-2712.

Relative Stereochemistry of 6. The stereochemistry of trans in the six-membered ring and that of $E$ for the $\mathrm{C}=\mathrm{C}$ bond were assigned by the ${ }^{1} \mathrm{H}$ NMR coupling constants for ring protons at the 2 and 3-positions ( $J=9.3-9.9 \mathrm{~Hz}$ ) and that for olefinic protons ( $J=15.0-15.6 \mathrm{~Hz}$ ), respectively. Absolute Configuration of $\mathbf{6 c}$. For the determination of the absolute configuration, $\mathbf{6 c}$ was transformed into vi, which was subjected to the mandelate method reported by Trost et al. for determination of absolute configuration of secondary alcohols. Oxidative cleavage of the $\mathrm{C}=\mathrm{C}$ bond of $6 \mathbf{c}$ afforded aldehyde iv. Methylation with methylmagnesium bromide followed by treatment with Dess-Martin periodinane gave methyl ketone $\mathbf{v}$. Baeyer-Villiger oxidation with trifluoroacetic anhydride $-\mathrm{H}_{2} \mathrm{O}_{2}$ followed by deacetylation afforded tetrahydropyranol vi in $52 \%$ yield from the starting 6 c . Esterification with $(R)$ - $O$-methylmandelic acid in the presence of DCC provided the corresponding mandelate vii exhibiting the ${ }^{1} \mathrm{H}$ NMR signal for $\mathrm{H}^{2}$ at 3.03 ppm , which was at higher field than the corresponding signal for the possible diastereomer ( 3.18 ppm ). According to the Trost's report, the stereochemistry at the 3-position was determined to be $S$.

Enantiomeric Excesses of $\mathbf{6 a - g}$. The enantiomeric excess of $\mathbf{6 b}$ was determined by chiral GC with Cyclodextrine- $\beta$-236M-19 column ( $0.25 \mathrm{~mm} \times 50 \mathrm{~m}$ ). 3-Alkenylpyrans 6a,c-g were
transformed into the corresponding pyran-3-ylmethanol derivatives viii as shown in the following equation. The HPLC analyses were carried out for their $N$-(3,5-dinitrophenyl)carbamates viii'.

Relative Stereochemistry of 7. Relative stereochemistry at the 1,6 , and 9 positions was determined by NOE experiments of 7. Relative configurations at the 7 and 8 positions were determined by NOE experiments for a phthalate derivative which was prepared by oxidation of the $\mathrm{Si}-$ C bond followed by reaction with phthalic anhydride.

Enantiomeric Excess of 9. HPLC analysis was carried out for its $N$-(3,5-dinitrophenyl)urethane derivative $\mathbf{9 '}^{\prime}$.
