100	11.61	3.0	325860	1.83 <sub>4</sub>	3.4053	10.3		
100	17.71	3.0	225680	1.92 <sub>0</sub>	4.6649	10.1		

<sup>a</sup> Initiators: 2,2'-azobis(2,4-dimethylpentanenitrile) at 45°C, AIBN at 60 and 80°C, *tert*-butyl peroxybenzoate at 100°C.

<sup>b</sup> Determined by GPC, calibrated with PMMA standards. Estimated error in  $\bar{M}_n$  is  $\pm 5\%$

<sup>c</sup> Value of  $-\frac{d(\ln P_i)}{di}$  (see text).

<sup>d</sup> From traditional Mayo analysis.

<sup>e</sup> Numbers in parentheses are based on weight average molecular weights and an assumed polydispersity of 2.0.<sup>24</sup>

<sup>f</sup> From  $\ln$  chain length distribution method.

<sup>g</sup> Broad distribution due to low molecular weight tail.

<sup>h</sup> Large portion of molecular weight distribution exceeds exclusion limit of GPC columns. Data point not included in transfer constant determination.

<sup>i</sup> Estimated conversion low due to difficulty in obtaining representative sample from highly viscous mixture. Conversion probably  $\geq 10\%$ .
