# Highly Diastereoselective Aldol Additions of a Chiral Ethyl Ketone Enolate Under Lewis Base Catalysis 

Scott E. Denmark and Son M. Pham<br>Roger Adams Laboratory, Department of Chemistry, University of Illinois, Urbana, Illinois 61801

## SUPPORTING INFORMATION

## General Experimental

All reactions were performed in oven and/or flame dried glassware under an atmosphere of dry nitrogen. Dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ was distilled from $\mathrm{P}_{2} \mathrm{O}_{5}$, silicon tetrachloride was distilled immediately before use. Analytical thin-layer chromatography was performed on Merck silica gel plates with QF-254 indicator. Analytical supercritical fluid chromatography (SFC) was performed on a Berger Instruments ${ }^{1}$ packed-column SFC with a built-in photometric detector ( $\lambda=220 \mathrm{~nm}$ ) using a Daicel Chiralpak AD and AS column, as indicated. Kugelrohr (bulb-to-bulb) distillations were performed on a Büchi GKR-50 Kugelrohr; boiling points (bp) correspond to uncorrected air-bath temperatures (ABT). All temperatures correspond to internal reaction temperatures measured by Teflon-coated thermocouples unless otherwise noted.
${ }^{1} \mathrm{H}$ NMR spectra and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Unity Inova 500 (500 $\mathrm{MHz})$ spectrometer and a Varian Unity $500(125 \mathrm{MHz})$ spectrometer, respectively. Spectra are referenced to residual chloroform $\left(\delta 7.26,{ }^{1} \mathrm{H} ; \delta 77.0,{ }^{13} \mathrm{C}\right)$. Chemical shifts are reported in ppm $(\delta)$; multiplicities are indicated by s (singlet), d (doublet), t (triplet), q (quartet), quint (quintet), sext (sextet), m (multiplet) and br (broad). Coupling constants, $J$, are reported in Hertz. Mass spectrometry was performed by the University of Illinois Mass Spectrometry Center. Data are reported in the form of $\mathrm{m} / \mathrm{z}$ (intensity relative to base peak $=100$ ). Infrared spectra (IR) were recorded on a Mattson Galaxy 5020 spectrophotometer. Peaks are reported in $\mathrm{cm}^{-1}$ with the indicated relative intensities: br (broad); s (strong, 67-100\%); m (medium, 34-66\%); w (weak, 0$33 \%$ ). Optical rotations were obtained on a Jasco DIP-360 digital polarimeter and are reported
as follows: $[\alpha]_{\mathrm{D}}^{\mathrm{T}}$ temperature (T), concentration ( $\mathrm{c}=\mathrm{g} / 100 \mathrm{~mL}$ ) and solvent. Elemental analyses were performed by the University of Illinois Microanalytical Service Laboratory.

## Literature Preparations

(S)-2-Hydroxy- $N$-methoxy- $N$-methylpropionamide $(\mathbf{6})^{2}$ was prepared according to a modified procedure of Luke and Morris. ${ }^{3}$ (S)-2-Hydroxy-3-pentanone (7) ${ }^{4}$ was prepared according the method of Paterson. ${ }^{2}$ 3-Phenyl propynal was prepared from DMF according to the method of Journet and Cai. ${ }^{5}$ Achiral phosphoramides 1 and chiral phosphoramides 2 were prepared according to the literature and used as analytically pure samples. ${ }^{6}$

## Experimental Procedures

(-)-(S)-(Z)-Trimethyl[(1-((1-((dimethyl)-(1,1-dimethylethyl)silyl)oxy)ethyl)propenyl)oxy]
silane (4)

Trimethylsilyl trifluoromethanesulfonate (TMSOTf) ( $240 \mu \mathrm{~L}, 1.32 \mathrm{mmol}, 1.2 .0$ equiv) was dissolved in benzene ( 2 mL ) at room temperature. Triethylamine ( $210 \mu \mathrm{~L}, 1.65 \mathrm{mmol}, 1.5$ equiv) was carefully added via syringe and the entire solution was cooled in an ice bath. Silyloxy ketone 3 ( $232 \mathrm{mg}, 1.1 \mathrm{mmol}$ ) was then added dropwise via syringe. The reaction was allowed to warm to room temperature and monitored by TLC. After 3 h , the biphasic mixture was quickly poured in to cold water $\left(10 \mathrm{~mL}, 0^{\circ} \mathrm{C}\right)$ with rapid stirring. The layers were separated and the aqueous phase was extracted with pentane $(3 \times 5 \mathrm{~mL})$. The combined organic extracts were then washed with brine ( 5 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated to give a crude oil. The residue was distilled under reduced pressure to afford $288 \mathrm{mg}(96 \%)$ of $\mathbf{4}$ as a clear, colorless oil, suitable for use in subsequent reactions. To obtain an analytically pure
sample, 4 was sacrificially purified by chromatography $\left(\mathrm{SiO}_{2}\right.$, pentane $\left./ \mathrm{CH}_{2} \mathrm{Cl}_{2}, 6 / 1\right)$. The residue was again distilled under reduced pressure to afford $159 \mathrm{mg}(53 \%)$ of analytically pure 4. Analytical data for 4:
bp: $110^{\circ} \mathrm{C}(0.1 \mathrm{mmHg}, \mathrm{ABT})$

## (S)-(Z)-Trichloro[(1-((1-((dimethyl)-(1,1-dimethylethyl)silyl)oxy)ethyl)propenyl)oxy]silane

 (5)

Mercuric acetate ( $32 \mathrm{mg}, 0.1 \mathrm{mmol}$, 0.01 equiv) was suspended in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL}$ ) at room temperature. Silicon tetrachloride ( $2.3 \mathrm{~mL}, 20 \mathrm{mmol}, 2.0$ equiv) was then carefully added via syringe and the cloudy mixture was allowed to stir for several minutes. TMS enol ether 4 $(2.7 \mathrm{~g}, 10 \mathrm{mmol})$ was then added dropwise via syringe. The reaction was allowed to stir at room temperature and could be monitored by careful removal of $10 \mu \mathrm{~L}$ aliquots for ${ }^{1} \mathrm{H}$ NMR analysis. After 18 h , the mercury salts were allowed to settle and the supernatant was carefully transferred to a dry 35 mL round bottom flask via cannula. The volatile components were removed at 100 mmHg and the residual oil was purified by distillation to afford $2.3 \mathrm{~g}(65 \%)$ of $\mathbf{5}$ as a $15 / 1$ mixture of $Z / E$ isomers by ${ }^{1} \mathrm{H}$ NMR.

## Analytical data for 5:

## Catalyzed Aldol Additions: General Procedure I

(+)-(2S,4R,5S)-5-Hydroxy-4-methyl-5-phenyl-2-[((dimethyl)-(1,1-dimethylethyl)silyl)oxy]-3pentanone (8a) ${ }^{7}$ [Table 1, entry 1]

To a solution of 55 mg ( $0.15 \mathrm{mmol}, 0.15$ equiv) of $(R, R)$-2a in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ was added quickly trichlorosilyl enolate $\mathbf{5}(350 \mathrm{mg}, 1.0 \mathrm{mmol})$ and the solution was cooled to $-78{ }^{\circ} \mathrm{C}$. Benzaldehyde ( $102 \mu \mathrm{~L}, 1.0 \mathrm{mmol}$ ) was then added dropwise via syringe and the reaction mixture was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 2 h . The reaction mixture was then poured into a rapidly stirring sat. aq. $\mathrm{NaHCO}_{3}$ solution at $0{ }^{\circ} \mathrm{C}(30 \mathrm{~mL})$ and was allowed to stir at room temperature for up to 6 h . The heterogeneous mixture was then filtered through Celite, the organic phase was separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$. The organic extracts were combined, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated to give a crude oil. Purification of the residue by silica gel chromatography $\left(\mathrm{SiO}_{2}\right.$, pentane/ $\left.\mathrm{Et}_{2} \mathrm{O}, 6 / 1\right)$ afforded $284 \mathrm{mg}(88 \%)$ of $\mathbf{8 a}$ as a clear, colorless oil. The diastereomeric ratio was determined to have a relative dr of $16 / 1$ and an internal dr of $>50 / 1$ by SFC analysis.

## Analytical data for 8a:

${ }^{1}$ H NMR: $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$
7.38-7.20 (m, 5 H, $2 \times \mathrm{H}\left(\mathrm{C}^{\prime \prime}\right), 2 \times \mathrm{HC}\left(3^{\prime \prime}\right), \mathrm{HC}\left(4^{\prime \prime}\right)$ ); $5.06(\mathrm{dd}, J=5.0,2.8,1$ H, HC(5), syn,syn); 5.01 (dd, $J=5.0,2.8,1 \mathrm{H}, \mathrm{HC}(5)$, anti,syn); 4.77 (dd, $J=$ 8.5, 4.2, $1 \mathrm{H}, \mathrm{HC}(5)$, anti-relative); 4.73 (dd, $J=8.5,4.2,1 \mathrm{H}, \mathrm{HC}(5)$, antirelative); 4.19 (q, $J=6.9,1 \mathrm{H}, \mathrm{HC}(2)$ ); 3.37 (dq, $J=7.2,5.0,1 \mathrm{H}, \mathrm{HC}(4)$ ); $3.25,(\mathrm{~d}, J=2.8,1 \mathrm{H}, \mathrm{OH}) ; 1.27\left(\mathrm{~d}, J=6.9,3 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}(1)\right) ; 1.05(\mathrm{~d}, J=7.2,3$ $\mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(1^{\prime}\right)$ ); 0.90 (s, $9 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(3^{\prime \prime \prime}\right)$ ); 0.08 (s, $3 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(1^{\prime \prime \prime}\right)$ ); 0.06 (s, 3 H , $\left.\mathrm{H}_{3} \mathrm{C}\left(1^{\prime \prime}\right)\right)$

TLC: $R_{f} 0.15$ (pentane/Et $t_{2} \mathrm{O}, 6 / 1$, anisaldehyde)

SFC: $t_{\mathrm{R}}(2 S, 4 R, 5 S)$-8a, 5.1 min (Daicel Chiralpak AD, $5 \% \mathrm{MeOH}$ in $\mathrm{CO}_{2}, 150$ bar, $40^{\circ} \mathrm{C}, 3.0 \mathrm{~mL} \mathrm{~min}^{-1}$ )

## (+)-(2S,4R,5S)-5-Hydroxy-4-methyl-5-phenyl-2-[((dimethyl)-(1,1-dimethylethyl)silyl)oxy]-3-

 pentanone (8a) ${ }^{7}$ [Table 1, entry 2]

Following General Procedure I: from trichlorosilyl enolate 5 ( $350 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), (S,S)2a ( $55 \mathrm{mg}, 0.15 \mathrm{mmol}, 0.15$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ and benzaldehyde ( $102 \mu \mathrm{~L}, 1.0 \mathrm{mmol}$ ) was obtained after chromatography, $258 \mathrm{mg}(80 \%)$ of $\mathbf{8 a}$ as a clear, colorless oil. The diastereomeric ratio was determined to have a relative dr of $15 / 1$ and an internal dr of $30 / 1$ by SFC analysis.

Analytical data for 8a:

 pentanone (8a) ${ }^{7}$ [Table 1, entry 6]

5

Following General Procedure I: from trichlorosilyl enolate 5 ( $350 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), 1c ( 51 $\mathrm{mg}, 0.15 \mathrm{mmol}$, 0.15 equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ and benzaldehyde ( $102 \mu \mathrm{~L}, 1.0 \mathrm{mmol}$ ) was obtained after chromatography, $216 \mathrm{mg}(67 \%)$ of $\mathbf{8 a}$ as a clear, colorless oil. The diastereomeric ratio was determined to have a relative dr of $15 / 1$ and an internal dr of $3 / 1$ by SFC analysis.

## Analytical data for 8a:

## Catalyzed Aldol Additions: General Procedure II

(+)-(2S,4R,5S)-5-Hydroxy-4-methyl-5-phenyl-2-[((dimethyl)-(1,1-dimethylethyl)silyl)oxy]-3-
pentanone (8a) ${ }^{7}$ [Table 3, entry 1]

4

Silyl enol ether 4 ( $273 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was added quickly to a stirred suspension of silicon tetrachloride ( $230 \mu \mathrm{~L}, 2.0 \mathrm{mmol}, 2.0$ equiv) and mercuric acetate $(3.2 \mathrm{mg}, 0.01 \mathrm{mmol}, 0.01$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ at room temperature. After addition, the mixture was stirred at room temperature for 18 h , then the volatile components were removed under reduced pressure ( 0.1 mmHg ) to give a cloudy oil. A solution of ( $R, R$ )-2a(18 mg, $0.05 \mathrm{mmol}, 0.05$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(2.0 \mathrm{~mL})$ was then added via cannula and the mixture was cooled to $-78^{\circ} \mathrm{C}$. Benzaldehyde ( 102 $\mu \mathrm{L}, 1.0 \mathrm{mmol}$ ) was then added dropwise via syringe and the reaction mixture was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 10 h . The reaction mixture was then poured into a rapidly stirring sat. aq. $\mathrm{NaHCO}_{3}$ solution ( 30 mL ) submerged in an ice bath and was allowed to stir at room temperature for 6 h . The heterogeneous mixture was then filtered through Celite, the organic phase was separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$. The organic extracts were combined, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated to give a crude oil. Purification by silica gel chromatography $\left(\mathrm{SiO}_{2}\right.$, pentane $\left./ \mathrm{Et}_{2} \mathrm{O}, 6 / 1\right)$ afforded $284 \mathrm{mg}(88 \%)$ of $\mathbf{8 a}$ as a clear, colorless oil. The diastereomeric ratio was determined to be (syn,syn)-8a/minor isomers, $95 / 5$ by SFC analysis.

## Analytical data for 8a:

## (-)-(2S,4R,5S)-(E)-5-Hydroxy-4-methyl-2-[((dimethyl)-(1,1-dimethylethyl)silyl)oxy]-6-octen-

3-one (8c) [Table 3, entry 6]

Following General Procedure II: from silyl enol ether 4 ( $273 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), silicon tetrachloride $(230 \mu \mathrm{~L}, 2.0 \mathrm{mmol}, 2.0$ equiv) and mercuric acetate $(3.2 \mathrm{mg}, 0.01 \mathrm{mmol}, 0.01$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ followed by $\mathrm{HMPA}\left(26 \mu \mathrm{~L}, 0.15 \mathrm{mmol}, 0.15\right.$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (2.0 $\mathrm{mL})$ and $(E)$-crotanaldehyde ( $83 \mu \mathrm{~L}, 1.0 \mathrm{mmol}$ ) was obtained after chromatography, 238 mg ( $83 \%$ ) of $8 \mathbf{c}$ as a clear, colorless oil. The diastereomeric ratio was determined to be (syn,syn)8c/minor isomers, 84/15/1 by SFC analysis.

Analytical data for 8c:
${ }^{1} \underline{\mathrm{H} \mathrm{NMR}}:\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$
$5.71(\mathrm{dq}, J=15.2,6.4,1 \mathrm{H}, \mathrm{HC}(7)) ; 5.44(\mathrm{ddd}, J=15.4,6.4,1.7,1 \mathrm{H}, \mathrm{HC}(6))$;
4.33 (br s, $1 \mathrm{H}, \mathrm{HC}(5)) ; 4.22$ (q, $J=7.1,1 \mathrm{H}, \mathrm{HC}(2)$ ); 3.19 (dq, $J=7.1,3.9,1$

7.90-7.44 (m, 7 H, HC(2"), HC(3"), HC(4"), HC(6"), HC(7"), HC(8"), $\mathrm{HC}\left(9^{\prime \prime}\right)$ ); 5.88 (br s, $1 \mathrm{H}, \mathrm{HC}(5)$ ); 4.27 (q, $J=6.9,1 \mathrm{H}, \mathrm{HC}(2)$ ); 3.70 (d, $J=$ $1.9,1 \mathrm{H}, \mathrm{OH}) ; 3.59$, (dq, $J=7.3,2.8,1 \mathrm{H}, \mathrm{HC}(4)) ; 1.35(\mathrm{~d}, J=6.9,3 \mathrm{H}$, $\left.\mathrm{H}_{3} \mathrm{C}(1)\right) ; 1.05$ (d, $\left.J=7.3,3 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(1^{\prime}\right)\right) ; 0.86\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(3^{\prime \prime \prime}\right)\right) ; 0.10(\mathrm{~d}, J=$ $\left.1.9,6 \mathrm{H}, \mathrm{H}_{3} \mathrm{C}\left(1^{\prime \prime \prime}\right)\right)$

TLC: $R_{f} 0.19$ (pentane/ $\mathrm{Et}_{2} \mathrm{O}, 6 / 1$, anisaldehyde)
SFC: $t_{\mathrm{R}}(2 S, 4 R, 5 R)-\mathbf{8 f}, 2.8 \mathrm{~min}$ (Daicel Chiralpak AS, $4 \% \mathrm{MeOH}$ in $\mathrm{CO}_{2}, 150$ bar, $40^{\circ} \mathrm{C}, 3.0 \mathrm{~mL} \mathrm{~min}^{-1}$ )

## (-)-(2S,4R,5R)-5-Hydroxy-4-methyl-5-(2-naphthyl)-2-[((dimethyl)-(1,1-dimethylethyl)

 silyl)oxy]-3-pentanone (8g) [Table 3, entry 13]

4

10 h

8

Following General Procedure II: from silyl enol ether 4 ( $273 \mathrm{mg}, 1.0 \mathrm{mmol}$ ), silicon tetrachloride ( $230 \mu \mathrm{~L}, 2.0 \mathrm{mmol}, 2.0$ equiv) and mercuric acetate ( $3.2 \mathrm{mg}, 0.01 \mathrm{mmol}, 0.01$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ followed by $(R, R)-\mathbf{2 a}\left(18 \mathrm{mg}, 0.05 \mathrm{mmol}, 0.05\right.$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 2.0 mL ) and 2-naphthaldehyde ( $156 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was obtained after chromatography, 265 mg ( $71 \%$ ) of $\mathbf{8 g}$ as a clear, colorless oil. The diastereomeric ratio was determined to be (syn,syn)-8g/ minor isomers, $94 / 3 / 3$ by SFC analysis.

## Analytical data for $\mathbf{8 g}$ :

${ }^{1} \underline{\mathrm{H} \mathrm{NMR}}:\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right)$
