2-Acetoxy-6-(bromomethyl)pyridine 11: 2-Acetoxy-6-methylpyridine (10, prepared following literature procedures ${ }^{1}$ ) ( $200 \mathrm{mg}, 1.32 \mathrm{mmol}$ ), 2, $2^{\prime}$-azobisisobutyronitrile (AIBN, $11 \mathrm{mg}, 5 \mathrm{~mol} \%$ ) and $\mathrm{CCl}_{4}(50 \mathrm{~mL})$ were introduced into a 100 mL two-necked round-bottomed flask fitted with a reflux condenser and nitrogen inlet. The mixture was heated at reflux, and N-bromosuccinimide (NBS, 236 $\mathrm{mg}, 1.32 \mathrm{mmol}$ ) was added in 20 mg portions over a period of 2 hours. The resulting mixture was refluxed overnight. Two thirds of the solvent was evaporated under house vacuum and the mixture was allowed to cool down to room temperature and filtered. The filtrate was concentrated to give a yellow residue. This was chromatographed on silica gel ( $30 \mathrm{~cm} \times 1.5 \mathrm{~cm}$ ), eluting with $\mathrm{EtOAc} / \mathrm{hexane}$ (1:4) to afford $160 \mathrm{mg}(52 \%)$ of the title compound as a colorless crystalline solid. $\mathbf{m p}: 55-56{ }^{\circ} \mathrm{C}$. ${ }^{1} \mathbf{H} \mathbf{~ N M R}$ $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 7.80$ (app.t, $J=7.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.38 (d, $J=7.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.04 (d, $\left.J=8.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.50$ $(\mathrm{s}, 2 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 168.8,157.1,156.1,140.5,121.7,115.9,32.9$, 21.6. HRMS (ES): calculated for $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{NBrO}\left(\mathrm{M}-\mathrm{CH}_{2}=\mathrm{C}=\mathrm{O}+1\right)$ 187.9711. Found: 187.9718.

Pyridone 13: To a solution of methyl(pyridin-2-ylmethyl)amine (12, $200 \mathrm{mg}, 1.64 \mathrm{mmol}$, prepared following literature procedures ${ }^{2}$ ) and triethylamine ( $600 \mu \mathrm{~L}, 6$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL}$ ) was added a solution of 2-acetoxy-6-(bromomethyl)pyridine (11, $170 \mathrm{mg}, 0.74 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$. The resulting mixture was stirred at room temperature for two hours. The reaction mixture was washed with water ( $4 \mathrm{~mL} \times 2$ ) and the aqueous layer was extracted with more $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL} \times 2)$. The combined organic layers were washed with brine ( $4 \mathrm{~mL} x 2$ ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and the solvent evaporated to give a yellow-brown oil. This was chromatographed on silica gel ( $30 \mathrm{~cm} \times 1.5 \mathrm{~cm}$ ), eluting with $\mathrm{EtOAc} / \mathrm{MeOH}(8: 1)$ to afford $83 \mathrm{mg}(49 \%)$ of the title compound as a colourless viscous oil. ${ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 10.59(\mathrm{bs}, 1 \mathrm{H}), 8.60(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.70(\mathrm{dt}, J=7.6,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.40(\mathrm{~d}$, $J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.32(\mathrm{dd}, J=9.2,6.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.21$ (app.dd, $J=7.2,5.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.45(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H})$, $6.05(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.78(\mathrm{~s}, 2 \mathrm{H}), 3.50(\mathrm{~s}, 2 \mathrm{H}), 2.31(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C} \mathbf{N M R}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 163.8$, 157.8, 149.2, 145.2, 140.9, 136.9, 123.4, 122.6, 119.5, 104.6, 63.1, 57.7, 42.9. HRMS (ES): calculated for $\mathrm{C}_{13} \mathrm{H}_{16} \mathrm{~N}_{3} \mathrm{O}(\mathrm{M}+1)$ 230.1293. Found: 230.1298. $\mathbf{U V} \lambda_{\text {max }}$ (water:MeCN 9:1 $+\mathrm{TFA}, \mathrm{c}=2 \times 10^{-4} \mathrm{M}$ ) 260, 285, 300 ( $\varepsilon=3,300 ; 3,000 ; 3,700$ ).

Carbamate 9: To a solution of pyridone $13(83 \mathrm{mg}, 0.36 \mathrm{mmol}$ and $N$-methyl- $N$-phenylcarbamoyl chloride ( $\mathbf{1 5}$, from Aldrich, $183 \mathrm{mg}, 3$ equiv.) in anhydrous acetonitrile ( 15 mL ) was added triethylamine $(350 \mu \mathrm{~L})$. The resulting mixture was heated at reflux overnight. The mixture was evaporated to dryness affording a yellow-brown oil. This was chromatographed on silica gel ( 30 cm x 1.5 cm ), eluting with $\mathrm{EtOAc} / \mathrm{MeOH}(4: 1)$ to afford $110 \mathrm{mg}(87 \%)$ of the title compound as a colorless viscous oil. ${ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CD}_{3} \mathrm{COCD}_{3}, 400 \mathrm{MHz}\right): \delta 8.49(\mathrm{~m}, 1 \mathrm{H}), 7.84(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.74(\mathrm{dt}, J=7.2$, $1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.51-7.46(\mathrm{~m}, 3 \mathrm{H}), 7.43-7.39(\mathrm{~m}, 2 \mathrm{H}), 7.27(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.23-$

[^0]$7.19(\mathrm{~m}, 1 \mathrm{H}), 7.01(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 2 \mathrm{H}), 3.69(\mathrm{~s}, 2 \mathrm{H}), 3.40(\mathrm{~s}, 3 \mathrm{H}), 2.27(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR $\left(\mathrm{CD}_{3} \mathrm{COCD}_{3}, 100 \mathrm{MHz}\right): \delta 160.2,159.6,158.7,153.5,149.5,143.9,140.4,136.9,129.6,127.1,126.8$, 123.4, 122.6, 120.9, 114.9, 64.2, 63.5, 42.9, 38.4. HRMS (ES): calculated for $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{~N}_{4} \mathrm{O}_{2}(\mathrm{M}+1)$ 363.1821. Found: 363.1809. UV $\lambda_{\max }\left(\mathrm{MeCN}+\mathrm{TFA}, \mathrm{c}=2 \times 10^{-4} \mathrm{M}\right) 260,285(\varepsilon=13,700 ; 800) ; \lambda_{\max }$ ( $\left.\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 1: 1+\mathrm{TFA}\right) 260,285(\varepsilon=8,800 ; 900)$.
$N$-Methylaniline: UV $\lambda_{\text {max }}\left(\right.$ water: $\left.\mathrm{MeCN} 9: 1+\mathrm{TFA}, \mathrm{c}=2 \times 10^{-4} \mathrm{M}\right) 254,260,276,280,285(\varepsilon=300$, 250, 90, 90, 90).

## Kinetic studies, general procedures.

Ionic strength was maintained with $\mathrm{NaClO}_{4}$. pHs reported are those of the buffer solution prior to dilution with the organic solvent. ${ }^{3}$ The buffers used were of the aminosulfonate type since these are known ${ }^{4}$ to be poor ligands to divalent metals. Buffers used: 2-( $N$-morpholino)ethanesulfonic acid hydrate (MES, $\mathrm{pK}_{\mathrm{a}}=6.1$ ), 2-\{[tris(hydroxymethyl)methyl]amino\}-1-ethanesulfonic acid (TES, $\mathrm{pK}_{\mathrm{a}}=7.5$ ), $\quad N$-[tris(hydroxymethyl)methyl]-3-aminopropane-1-sulfonic acid (TAPS, $\mathrm{pK}_{\mathrm{a}}=8.4$ ), 2(cyclohexylamino)ethanesulfonic acid (CHES, $\mathrm{pK}_{\mathrm{a}}=9.3$ ), 3-(cyclohexylamino)-1-propanesulfonic acid (CAPS, $\mathrm{pK}_{\mathrm{a}}=10.4$ ). Reactions were followed by reverse-phase HPLC (C18) by monitoring the changes in the areas of the $N$-methylaniline and carbamate 9 peaks at 254 nm (carbamate elutes at 4.75 min and aniline at 2.01 min in $65: 35$ water/acetonitrile containing $0.1 \% \mathrm{v} / \mathrm{v}$ trifluoroacetic acid) and the area of the pyridone 13 peak at 300 nm ( 2.01 minutes). From the areas, concentrations were calculated using an external calibration method. Areas vs concentration plots were linear between $0-10 \mathrm{mM}$ for aniline, $0-8 \mathrm{mM}$ for carbamate and $0-5 \mathrm{mM}$ for pyridone. Two mM solutions of the complex were used for kinetic studies. The majority of reactions were followed to at least $95 \%$ completion and all of them (except when the contrary has been stated in the discussion) obeyed first-order reaction kinetics. Values of $\mathrm{k}_{\text {obs }}$ were calculated from the plots of $\ln$ [carbamate] vs time, using computer-assisted least-squares regression analysis (Excel 2000). Correlation coefficients were generally $>0.99$ and never $<0.985$.
