Supporting Information Available. Selected experimental procedures and characterization data (including ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra) for compounds $\mathbf{6 a - f}$ and $\mathbf{7 - 1 0}$. This material is available free of charge via the Internet at http://pubs.acs.org.

General. Tetrahydrofuran (THF) was freshly distilled from sodium / benzophenone ketyl radical. Benzene, diisopropylamine and triethylamine were distilled from calcium hydride prior to use. DMF ( $99.99 \%$ anhydrous) was purchased from Acros and used as received. Ethyl acetate and hexanes were used without purification. Trisyl azide ${ }^{1}$ and diBoc thiourea ${ }^{2}$ were prepared according to known procedures. Benzyl bromide, allyl bromide and methyl iodide were filtered through a short plug of basic alumina prior to use in order to eliminate traces of acid. Benzyl chloroformate was flushed with a stream of dry air and stored over sodium sulfate. Other chemicals were purchased from Aldrich or Acros and used without purification. Reactions were followed by thin layer chromatography (TLC) on silica Merck $60 \mathrm{~F}_{254}(250 \mu \mathrm{~m}$ thick). TLC's were visualized with a UV lamp and stained using a solution of phosphomolybdic acid (80 g/L). Purifications of compounds were carried out by flash column chromatography using Whatman Silica ( $60 \AA, 230-400$ mesh). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were acquired using VARIAN spectrometers at the frequency indicated. Solvents are indicated for each compound. Chemical shifts are expressed in ppm referenced to TMS (in $\mathrm{CDCl}_{3}$ ) or to the solvent, as an internal standard. The multiplicity of signals are abbreviated as follows: app $=$ apparent, $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{t}=$ triplet, $\mathrm{m}=$ multiplet, br = broad signal. IR spectra were acquired using an Impact 910 Nicolet spectrometer in the solvent indicated. Vibration frequencies are expressed in $\mathrm{cm}^{-1}$. Optical rotations were measured with JASCO digital polarimeter DIP-360 ( $c$ indicates the concentration of the sample in $\mathrm{g} / 100 \mathrm{~mL}$ ) using a sodium lamp ( 589 nm ). Gas chromatography was performed on a 2,3-di- $O$-acetyl-6-O-tert-butyldimethylsilyl- $\beta$ cyclodextrin column ( 30 m ) at constant flow ( $3 \mathrm{~mL} / \mathrm{min}$ ) and constant temperature (indicated for each compound). Retention times are indicated in minutes.

General procedure for azidation. A solution of $0.500 \mathrm{~g}(2.57 \mathrm{mmol})$ of DKP 5 (azeotroped with anhydrous benzene) in 15 mL of THF was cooled to $-78 ; \mathrm{C}$ and treated with 5.15 mL ( 2.57 mmol ) of potassium bis-(trimethylsilyl)-amide $\left(0.5^{\circ} \mathrm{M}\right.$ in toluene). After 3 h at $-78 ; \mathrm{C}$, a pre-cooled solution of trisyl azide ( 3.1 mmol ) in 10 mL THF was added to the enolate via cannula. After 2.5 h , the reaction was quenched with 1.16 g ( 11.84 mmol ) of potassium acetate dissolved in 2 mL of distilled water. The cooling bath was removed and the mixture was allowed to stir overnight at $25 ; \mathrm{C}$. The volatiles were

After 30 minutes under $\mathrm{H}_{2}$, the mixture was filtered over Celite and ethanol was removed in vacuo. The crude amine was partially dissolved in 20 mL freshly distilled benzene and refluxed for 3 h . After removal of solvent in vacuo the crude oil was purified on silica gel chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOAc}, 1: 1\right)$ to provide the tetracyclic tris-lactam 10 ( $20.2 \mathrm{mg}, 68 \%$ ) as a white crystalline solid: mp 110-113 CC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} /\right.$ pentane $) ; \mathrm{R}_{\mathrm{f}} 0.31\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOAc}, 1: 1\right) ;{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.33(\mathrm{br}$ $\mathrm{s}, 1 \mathrm{H}), 3.53-3.57(\mathrm{~m}, 2 \mathrm{H})$ and $3.45(\mathrm{app} \mathrm{dd}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.89-2.97(\mathrm{~m}, 1 \mathrm{H}), 2.45-2.61$ $(\mathrm{m}, 2 \mathrm{H}), 2.00-2.27(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.2,165.7,164.5,78.6$, 75.0, 44.1, 44.0, 27.7, 25.4, 24.6, 22.5; IR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 3550$ (broad) 1747, 1711; ESI HRMS calculated for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{3} 258.0855[\mathrm{M}+\mathrm{Na}]$.
