Supplementary Material for:

# Kinetic Resolution of Racemic Lactones by Conjugate Additions of Allylic Organolithium Species: Formation of 3 Centers with High Diatereo- and Enantioselectivities 

Sung H. Lim and Peter Beak*<br>Department of Chemistry<br>University of Illinois at Urbana-Champaign<br>Urbana, IL 61801

## Experimental

General. All air-sensitive reactions were performed in oven or flame dried glassware under nitrogen with freshly distilled solvents. Toluene was distilled over $\mathrm{CaH}_{2}$, and diethyl ether, tetrahydrofuran (THF) was distilled from sodium and benzophenone. Commercial (-)-sparteine (Aldrich) was distilled and stored under nitrogen. Commercially available TEEDA was used to obtain racemic product and used without purification. $n$ - BuLi solution in hexanes $(1.6 \mathrm{M})$ was titrated prior to use against $N$-pivaloyl-o-toluidine. All other commercial reagents were used without further purification, unless otherwise indicated.

Preparative high-pressure liquid chromatography (HPLC) was performed using Rainin SD 200 pump system equipped with Dynamax-60-A $8 \mu \mathrm{~m}$ silica column (Rainin Instrument Co., $25 \mathrm{~cm} \times 21.4 \mathrm{~mm}$ i.d.) and Knauer UV detector ( 254 nm ). Analytical chiral stationary phase HPLC was performed using Rainin HPXL pump systems. Either Whelk-O (Regis Chemical Co., $25 \mathrm{~cm} \times 4.6 \mathrm{~mm}$ i.d.) or Chiralpak AD (Chiral Technologies Inc. $25 \mathrm{~cm} \times 4.6 \mathrm{~mm}$ i.d.) was used to obtain product enantiomeric purity. Analytical thin layer chromatography (TLC) was done on Merck silica plates ( 0.25 mm )
with QF-254 indicator. Either UV light or alkaline $\mathrm{KMnO}_{4}$ was used for TLC visualization. Flash chromatography was performed suing 230-400 mesh silica gel. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were acquired using either a Varian U400 ( $400 \mathrm{MHz}{ }^{1} \mathrm{H}, 100.6$ $\mathrm{MHz}{ }^{13} \mathrm{C}$ ) or U500 ( $500 \mathrm{MHz}{ }^{1} \mathrm{H}, 125.7 \mathrm{MHz}{ }^{13} \mathrm{C}$ ) spectrometer using $\mathrm{CDCl}_{3}$, acetone- $\mathrm{d}_{6}$ or DMSO as a solvent. Chemical shifts are reported in ppm relative to the solvent. Mass spectral data was obtained at the University of Illinois Mass Spectrometry Laboratory. Thomas-Hoover capillary melting point apparatus was used to determine uncorrected melting points. Purity of the sample is established to be $>95 \%$ based on ${ }^{13} \mathrm{C}$ NMR spectra. Diastereomeric purity was determined by ${ }^{1} \mathrm{H}$ NMR integration.
"Standard workup" refers to dilution with diethyl ether, addition of $\mathrm{H}_{2} \mathrm{O}$, separation of phases, extraction of the aqueous layer with ether (3x), combination of the organic phases, drying with $\mathrm{MgSO}_{4}$ and concentration by rotary evaporation.

4

## Representative Kinetic Resolution of Racemic Michael Acceptors: Preparation of

 (3R, 2'R, 3''S)-(4-Methoxy-phenyl)-[3-(2'-methyl-5-oxo-tetrahydro-furan-3-yl)-3''-phenyl-propenyl]-carbamic acid tert-butyl ester (4)To a stirring solution of $\mathbf{1}(249 \mathrm{mg}, 0.73 \mathrm{mmol})$ under a $\mathrm{N}_{2}$ atmosphere in 10 mL of toluene, ( - )-sparteine $(0.19 \mathrm{~mL}, 0.80 \mathrm{mmol})$ was added. The reaction mixture was cooled to $-78{ }^{\circ} \mathrm{C}$, and $n-\mathrm{BuLi}(0.51 \mathrm{~mL}, 0.80 \mathrm{mmol})$ was added and stirred for 15 min . The resulting mixture was slowly added to a precooled solution of 5-methyl 5 H -furan-2one ( $0.17 \mathrm{~mL}, 1.83 \mathrm{mmol}$ ) and $\mathrm{TMSCl}(0.47 \mathrm{~mL}, 3.7 \mathrm{mmol})$ in 5 mL of toluene. After stirring for 1 hr , the reaction mixture was quenched with MeOH , and warmed to rt. 3.7 mL of TBAF ( 3.7 mmol ) was added and stirred for additional 30 mins . The standard work-up afforded the crude product as a yellow oil, which was purified by column chromatography ( $25 \%$ ethyl acetate in hexane) to give the product as a clear oil ( 246 mg , $0.563 \mathrm{~mol}, 77 \%) .{ }^{1} \mathbf{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 1.35(\mathrm{~d}, 3 \mathrm{H}, J=6.5 \mathrm{~Hz}), 1.43(\mathrm{~s}, 9 \mathrm{H})$,
$1.91(\mathrm{dd}, 1 \mathrm{H}, J=17.7,6.8 \mathrm{~Hz}), 2.20(\mathrm{~m}, 1 \mathrm{H}), 2.28(\mathrm{dd}, 1 \mathrm{H}, J=17.4,8.9 \mathrm{~Hz}), 2.89(\mathrm{bs}$, $1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 4.33(\mathrm{~m}, 1 \mathrm{H}), 4.94(\mathrm{dd}, 1 \mathrm{H}, J=10.5,9.8 \mathrm{~Hz}), 6.67(\mathrm{~m}, 2 \mathrm{H}), 6.78(\mathrm{~m}$,
 $28.1,33.2,44.6,48.2,55.8,80.3,114.3,126.8,127.5,128.5,129.3,134.3,153.5,158.4$, 175.8. HRMS: Calcd for $\mathrm{C}_{26} \mathrm{H}_{31} \mathrm{~N}_{1} \mathrm{O}_{5}$ : 437.2202; found: 437.2203. The enantiomeric purity was determined to be $94: 6$ by CSP-HPLC analysis on a Pirkle concept Whelk-O column with $15 \%(\mathrm{v} / \mathrm{v})$ isopropyl alcohol/hexane mobile phase by a flow rate $1.2 \mathrm{~mL} / \mathrm{min}$. The major enantiomer had a retention time of 44.6 min and the minor enantiomer had a retention time of 40.0 min .

5
(3R, 2'R, $3^{\prime \prime} S$ )-(4-Methoxy-phenyl)-[3-(2'-ethyl-5-oxo-tetrahydro-furan-3-yl)-3'’-phenyl-propenyl]-carbamic acid tert-butyl ester ( $3 R, 2^{\prime} R, 3^{\prime} ' S$ )-(5)

The general kinetic resolution procedure was followed using 1 ( $183 \mathrm{mg}, 0.54$ mmol ) and 5-ethyl-5H-furan-2-one ( $152 \mathrm{mg}, 1.36 \mathrm{mmol}$ ) to afford crude mixture, which was purified by column chromatography ( $30 \%$ ethylacetate in hexane) to afford 5 (152 $\mathrm{mg}, 0.337 \mathrm{mmol}, 62 \%$ ) as a white crystals, and recovered $>32 \%$ of 5-ethyl-5H-furan-2one.
