Computational Protocols. Calculations were performed on SGI workstations using an R-4000 or $\mathrm{R}-10,000$ processor. Interactive fragment mapping with our previously described method ${ }^{1}$ was used for the positioning of functional groups around transitions states to identify optimal locations. For the 3-D database searching, the CAVEAT ${ }^{2,3}$ program was used along with the TRIAD (a database of tricyclic ring structures) and ILIAD (a database of acyclic structures) databases. Visualization of CAVEAT input and output was accomplished using a MacroModel interface. The Cambridge Structural Database and the CAS three-dimensional database were obtained separately and also used. CAVEAT databases were constructed using metals and lone pairs as searchable elements in addition to nonmetallic atoms as previously described. ${ }^{3}$ Also, vectors which possessed tips oriented towards each other were allowed. ${ }^{3}$ The features described above are available in the CAVEAT 2.2 b release.

Once a ligand was identified, it was appended to the transition state and extensive Monte Carlo conformational searching was performed using forcefield methods (MM2*) to evaluate all the possible conformational isomers. Calculations of boron transition states were initially performed with MM2* parameters for the boron allylation reaction ${ }^{4}$ in MacroModel 4.0/6.0.5 Additional MM2* parameters ${ }^{6}$ were introduced to allow boronate calculations. Results consistent with the enol boronate MNDO calculations of Gennari and Todeschini ${ }^{7}$ were observed. The searches produced a number of structures incorporating si and re facial attack of the aldehyde.

Subsequently, AM1 and HF calculations were performed using all the transition structure re and si geometries from MacroModel within $4.0 \mathrm{kcal} / \mathrm{mol}$ of the global minimum. Semi-empirical AM1 calculations were performed using Spartan $5.0^{8}$ while HF calculations employing 3-21G* and 6-31G* basis sets were performed using Spartan 5.0 or Gaussian $98 .{ }^{9}$ A Boltzmann distribution at the reaction temperature ( 195 K ) was used to calculate the $\pi$-facial selectivity for the attack on the aldehyde component at each level of theory (i.e., corresponding to the si:re ratio).

In previous studies, HF calculations using 3-21G basis sets were used to generate the transition states for related reactions and were found to be reliable. ${ }^{4,10}$ Due to the large number of transition states that we need to analyze to fully examine all the conformational isomers, we used HF /3-21G* or HF/6-31G* methods. For each reaction, 20-30 transition structures, each with approximately 30 heavy atoms, were optimized. All transition structure structures were confirmed as a true saddle points on the potential energy surface as characterized by the presence of one large imaginary frequency $\left(\sim 400 \mathrm{~cm}^{-1}\right)$. The imaginary frequency corresponds to bond breaking and formation expected for the allylation reaction coordinate.

General Experimental Considerations. Unless otherwise noted, all non-aqueous reactions were carried out under an atmosphere of dry $\mathrm{N}_{2}$ in dried glassware. When necessary, solvents and reagents were dried prior to use. Diethyl ether and dichloromethane were de-oxygenated by purging with $\mathrm{N}_{2}$ and then dried by passing through activated alumina Tetrahydrofuran and toluene were distilled from sodium and hexanes from calcium hydride. DMF was distilled from $\mathrm{CaH}_{2}$ under reduced pressure and oxalyl chloride was distilled prior to use.

Analytical thin layer chromatography (TLC) was performed on EM Reagents 0.25 mm silica-gel 60-F plates. Preparative thin layer chromatography was performed on EM Reagents 1.00 mm silicagel plates. Visualization was accomplished with UV light. Chromatography on silica gel was performed using a forced flow of the indicated solvent system on EM Reagents Silica Gel 60 (230-400 mesh). ${ }^{11}$ Conversions and enantiomeric excesses for the allylation reactions were measured using a Waters 600 high performance liquid chromatography (HPLC) with UV detection at 254 nm and a Daicel Chiralpak AD column ( $0.46 \mathrm{~cm} \times 25 \mathrm{~cm}$ ). ${ }^{1} \mathrm{H}$ NMR spectra were recorded on Bruker AM-500 ( 500 MHz ) or AM-250 ( 250 MHz ) spectrometers. Chemical shifts are reported in ppm from tetramethylsilane ( 0 ppm ) or from the solvent resonance $\left(\mathrm{CDCl}_{3} 7.26 \mathrm{ppm}, \mathrm{CD}_{2} \mathrm{Cl}_{2} 5.30 \mathrm{ppm}, \mathrm{DMSO}-\mathrm{d}_{6} 2.49\right.$ $\mathrm{ppm}, \mathrm{D}_{2} \mathrm{O} 4.80 \mathrm{ppm}$ ). Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{br}=$ broad, $\mathrm{m}=$ multiplet), coupling constants, and number of protons. Proton decoupled ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AM-500 ( 125 MHz ) spectrometer. Chemical shifts are reported in ppm from tetramethylsilane ( 0 ppm ) or from the solvent resonance $\left(\mathrm{CDCl}_{3} 77.36 \mathrm{ppm}\right)$. Mass spectra were obtained on a low resonance Micromass Platform LC in electron spray mode and high resonance VG autospec with an ionization mode of either CI or ES. IR spectra were taken on a Perkin-Elmer FT-IR spectrometer using a thin film on NaCl plates. Melting points were obtained on Thomas Scientific Unimelt apparatus and are uncorrected. Optical rotations were measured on a Perkin-Elmer Polarimeter 341 with a sodium lamp and are reported as follows $[\alpha]^{\mathrm{T}} \lambda$, (c g/100 mL solvent).

Compounds $\mathbf{4}$ and $\mathbf{5 b}$ were prepared according to the procedure of Lautens and Fillion. ${ }^{12}$ Characterization data for these compounds are in agreement with reported literature values.

4

Bis-alkene 5a. To a solution of ethyl iodide ( $2.2 \mathrm{~mL}, 26.9 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(60 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was added $t$-BuLi ( $43 \mathrm{~mL}, 53.8 \mathrm{mmol}, 1.2 \mathrm{M}$ in pentane) dropwise with stirring. The solution became cloudy and white. The reaction was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 45 min , then at ambient for 90 min . The mixture was then returned to $-78^{\circ} \mathrm{C}$, and transferred via cannula to a stirred solution of the bisoxabicycle $4(750 \mathrm{mg}, 2.69 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{~mL})$. The reaction was allowed to stir at $-78{ }^{\circ} \mathrm{C}$ for 1 h ,
then at $0^{\circ} \mathrm{C}$ for 90 min . The solution was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$, and the aqueous fraction was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 50 \mathrm{~mL})$. The combined organic fractions were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated. Purification by flash chromatography ( $3: 1$ hexanes:EtOAc) afforded 5a (827 $\mathrm{mg}, 91 \%$ ) as a white solid: $\mathrm{Rf}_{\mathrm{f}}=0.35\left(\mathrm{SiO}_{2}, 3: 1\right.$ hexanes:EtOAc); ${ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.44(\mathrm{~s}$, $2 \mathrm{H}), 3.97(\mathrm{~s}, 2 \mathrm{H}), 3.74-3.71(\mathrm{~d}+\mathrm{s}, 10 \mathrm{~Hz}, 2 \mathrm{H}+2 \mathrm{H}), 3.28-3.24(\mathrm{~d}+\mathrm{s}, 10 \mathrm{~Hz}, 2 \mathrm{H}+6 \mathrm{H}), 1.85(\mathrm{brs}, 2 \mathrm{H})$, $1.80(\mathrm{~s}, 6 \mathrm{H}), 1.51$ (quintet, $7.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), 1.39 (quintet, $7.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), $0.95(\mathrm{t}, 7.4 \mathrm{~Hz}, 6 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 133.9,127.2,75.0,70.2,58.7,50.0,38.2,24.6,19.1,11.6$.

Diol 3a. To [Cy $\left.{ }_{3} \operatorname{PIr}(\mathrm{COD}) \mathrm{py}^{2}\right] \mathrm{PF}_{6}(32 \mathrm{mg}, 0.040 \mathrm{mmol})$ was added a solution of 5 a $(676 \mathrm{mg}, 2.00$ $\mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(70 \mathrm{~mL})$. The atmosphere was purged and the reaction was left stirring under an atmosphere of $\mathrm{H}_{2}$ overnight. The reaction mixture was concentrated via rotary evaporation. Purification by flash chromatography ( $3: 1$ hexanes:EtOAc) yielded $3 \mathrm{a}(663 \mathrm{mg}, 98 \%$ ) as a white solid. $\mathrm{R}_{\mathrm{f}}=0.40\left(\mathrm{SiO}_{2}, 3: 1\right.$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.93(\mathrm{~d}, 6.9 \mathrm{~Hz}, 2 \mathrm{H}), 3.42(\mathrm{~d}, 9.3 \mathrm{~Hz}$, $2 \mathrm{H}), 3.37(\mathrm{~d}, 8.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.26(\mathrm{~s}, 6 \mathrm{H}), 3.20(\mathrm{~d}, 9.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.06-1.98(\mathrm{~m}, 2 \mathrm{H}+2 \mathrm{H}), 1.57(\mathrm{~m}, 2 \mathrm{H}), 1.40$ (septet, $7.3 \mathrm{~Hz}, 2 \mathrm{H}), 1.26-1.20(\mathrm{~m}, 2 \mathrm{H}+2 \mathrm{H}), 1.09(\mathrm{~d}, 7.4 \mathrm{~Hz}, 6 \mathrm{H}), 0.91(\mathrm{t}, 7.4 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 74.7,73.3,58.8,46.6,34.7,34.3,32.4,25.6,21.3,11.7$.

Resolution of racemic diol 3a. Resolution was carried out using a Daicel semi-prep Chiralpak AD column ( $10 \times 250 \mathrm{~mm}$ ) and a Waters differential refractometer detector. Purified racemic diol (100 mg ) was dissolved in 10 mL of eluent ( $5 \% i-\mathrm{PrOH} /$ hexanes). A $900 \mu \mathrm{~L}$ aliquot was injected at a flow rate of $2.4 \mathrm{~mL} / \mathrm{min}: \mathrm{t}_{\mathrm{R}}(-)-\mathbf{3 a}=10.7, \mathrm{t}_{\mathrm{R}}(+)-\mathbf{3 a}=12.3 \mathrm{~min}$.

Diol 3b. To [Cy ${ }_{3} \mathrm{P} \operatorname{Ir}(\mathrm{COD}) \mathrm{py}^{2} \mathrm{PF}_{6}(38 \mathrm{mg}, 0.0468 \mathrm{mmol})$ was added to a solution of $\mathbf{5 b}$ ( 925 mg , $2.35 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL})$. The atmosphere was purged and the reaction was left stirring under an atmosphere of $\mathrm{H}_{2}$ overnight. The reaction mixture was concentrated via rotary evaporation. Purification by flash chromatography ( $3: 1$ hexanes:EtOAc) yielded $3 b(933 \mathrm{mg}, 2.45 \mathrm{mmol}, 100 \%$ ) as a white solid. An analytical sample was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give colorless crystals suitable for X-ray analysis (see below). The X-ray structure established that the relative configuration and the preferred conformational form of $\mathbf{3 b}$ are those illustrated above. $\mathrm{mp} 114-116{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}=0.49\left(\mathrm{SiO}_{2}, 3: 1\right.$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 3.88(\mathrm{~s}, 2 \mathrm{H}), 3.39(\mathrm{~d}, 9.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.23(\mathrm{~s}, 6 \mathrm{H}), 3.17(\mathrm{~d}$, $9.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.55(\mathrm{brs}, 2 \mathrm{H}), 2.02-1.96(\mathrm{~m}, 4 \mathrm{H}), 1.71-1.60(\mathrm{~m}, 2 \mathrm{H}), 1.35-1.15(\mathrm{~m}, 16 \mathrm{H}), 1.05(\mathrm{~d}, 7.4 \mathrm{~Hz}, 6 \mathrm{H})$, $0.87(\mathrm{~m}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 75.0,73.3,58.7,46.3,34.7,32.7,32.5,32.0,29.2,22.8,21.3$, 14.1.

Resolution of racemic diol 3b. Resolution was carried out using a Daicel semi-prep Chiralpak AD column ( $10 \times 250 \mathrm{~mm}$ ) and a Waters differential refractometer detector. Purified racemic diol ( 500 mg ) was dissolved in $10 \% i$ - $\mathrm{PrOH} /$ hexanes $(4.0 \mathrm{~mL})$. The eluent was $2.5 \% i-\mathrm{PrOH} /$ hexanes, the flow rate was $2.4 \mathrm{~mL} / \mathrm{min}$, and $400 \mu \mathrm{~L}$ injections were used. With multiple overlapping runs, one gram of racemic material was resolved in five hours: $t_{R}(-)-3 \mathbf{b}=10.8 \mathrm{~min}, \mathrm{t}_{\mathrm{R}}(+)-\mathbf{3 b}=13.2 \mathrm{~min}$. The second fraction has $[\alpha]_{\mathrm{D}}^{20}=+5.76\left(\mathrm{c}=0.050, \mathrm{CHCl}_{3}, 100 \%\right.$ ee $)$.

Absolute configuration of diol $\mathbf{3 b}$ via Mosher ester analysis of $\mathbf{5 b}$. Compound $\mathbf{5 b}$ was resolved using CSP HPLC ( $5 \% i-\mathrm{PrOH} /$ hexanes; $\mathrm{t}_{\mathrm{R}}(-)-5 \mathbf{b}=9.2, \mathrm{t}_{\mathrm{R}}(+)-\mathbf{5 b}=13.3 \mathrm{~min}$ ) as described above for 3a. Each enantiomer of $\mathbf{5 b}$ was converted to the corresponding Mosher ester. Microscale Mosher esterifications were performed following the procedure of Ward and Rhee. ${ }^{13}$ (R)-(+)-MTPA (2.1 equivalents) was dissolved in hexanes. DMF ( 2.1 equivalents) and oxalyl chloride ( 4.2 equivalents) were added and the mixture stirred for 2 h . The clear, colorless supernatant was extracted from an oily, yellow residue ( DMFCl ) using a syringe, filtered through a glass wool plug, and concentrated via rotary evaporation to give a clear, colorless oil ((S)-(+)-MTPACl)..$^{14}$

In a vial, a solution of the diol (1.0 equivalent) was mixed with DMAP (few crystals), $\mathrm{CDCl}_{3}$ ( 0.5 mL ), and $\mathrm{Et}_{3} \mathrm{~N}$ (3.0 equivalents). This solution was added dropwise to the MTPACl and stirred overnight, giving a clear, yellow solution which was directly analyzed by NMR.

(R)-(+)-4-Hydroxy-6-phenyl-1-hexene siattack

General Procedure for the Boron Allylation of Dihydrocinnamaldehyde. ${ }^{13,14}$ A solution of the allylboronate ( 0.354 mmol ) in toluene $(0.5 \mathrm{~mL})$ was added to flame-dried Schlenk flask containing $4 \AA$ molecular sieves (powdered, 50 wt relative to the ligand). At $-78{ }^{\circ} \mathrm{C}$ hydrocinnamaldehyde ( $72.5 \mu \mathrm{~L}$, 0.551 mmol , 1.56 equivalents), dissolved in toluene $(\sim 0.5 \mathrm{~mL})$, was added dropwise over 30 min . After overnight at $-78{ }^{\circ} \mathrm{C}$, a solution of $\mathrm{NaBH}_{4}(23.0 \mathrm{mg}, 0.610 \mathrm{mmol}, 1.70$ equivalents) in EtOH ( $\sim 2$ mL ) was added to consume any remaining aldehyde; the aldehyde greatly complicates the HPLC analysis. After stirring at room temperature for 1.5 h , the reaction mixture was poured into $\mathrm{H}_{2} \mathrm{O}(10$ $\mathrm{mL})$, extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times 10 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated in vacuo., and chromatographed to afford 4-hydroxy-6-phenyl-1-hexene identical to that reported previously: ${ }^{17}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500\right.$ $\mathrm{MHz}) \delta$ 7.26-7.30 (m, 2H, Ph), 7.16-7.23 (m, 3H, Ph), 5.78-5.88 (m, 1H, H2C=CHR), 5.13-5.17 (m, 2H, $\mathbf{H}_{2} \mathrm{C}=\mathrm{CHR}$ ), 3.64-3.72 (m, 1H, RR'CH(OH)), 3.68-3.88 (m, 2H, $\left.\mathrm{PhCH}_{2} \mathrm{R}\right), 2.16-2.37(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{H}_{2} \mathrm{C}=\mathrm{CHCH}_{2} \mathrm{R}$ ), 1.77-1.83 (m, 2H, $\mathrm{PhCH}_{2} \mathrm{CH}_{2} \mathrm{R}$ ), $1.59(\mathrm{~d}, \mathrm{~J}=4.2 \mathrm{~Hz}, \mathrm{ROH}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 125$ MHz ) $\delta 32.0,38.4,42.0,69.9,118.1,125.8,128.27,128.33,128.37,134.6,142.0$.

The enantiomeric excess was determined by chiral HPLC while the configuration was determined by Mosher ester analysis (see below) and confirmed by comparison of the optical rotation to literature values: CSP HPLC (OD, 99:1 hexanes: $i-\operatorname{PrOH}, 0.8 \mathrm{~mL} / \mathrm{min}) \mathrm{t}_{\mathrm{R}}(\mathrm{S})=19.9 \mathrm{~min}, \mathrm{t}_{\mathrm{R}}(R)=33.2 \mathrm{~min} ;[\alpha]_{\mathrm{D}}^{22}=$ $-10.6\left(\mathrm{c}=2.30,39 \%\right.$ ee $\left.(S), \mathrm{C}_{6} \mathrm{D}_{6}\right) ;[\alpha]_{\mathrm{D}}^{2}=-8.3\left(\mathrm{c}=2.49,39 \%\right.$ ee $\left.(S), \mathrm{CHCl}_{3}\right) ;[\alpha]_{D}^{2}\left(\mathrm{lit}^{18}\right)=+16.9(\mathrm{c}=1.0$, $80 \%$ ee $\left.(R), \mathrm{CHCl}_{3}\right) ;[\alpha]_{\mathrm{D}}^{55}\left(\mathrm{lit}^{19}\right)=-21.6\left(\mathrm{c}=1.19,95 \%\right.$ ee $\left.(S), \mathrm{CHCl}_{3}\right) ;\left[\alpha{ }_{\mathrm{D}}^{83}\left(\mathrm{lit}^{20}\right)=+11.1(\mathrm{c}=3.14,53 \%\right.$ ee $\left.(R), \mathrm{CHCl}_{3}\right)$.

$\mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMAP}, \mathrm{CDCl}_{3}$

Diagnostic ${ }^{1} \mathrm{H}$ NMR Peaks for the Mosher Esters of the Two Enantiomers of 4-Hydroxy-6-phenyl-1-hexene. The Mosher Ester of 4-hydroxy-6-phenyl-1-hexene were prepared as described above for $5 \mathbf{b}:{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right) \delta 7.20-7.33(\mathrm{~m}, \mathrm{Ph},(S)$ enantiomer $)$, 7.11-7.21 (m, $\mathrm{Ph},(R)$ enantiomer), 5.70-5.80 (m, 1H, $\mathrm{H}_{2} \mathrm{C}=\mathrm{CHR}$, $(S)$ enantiomer), 5.60-5.70 (m, 1H, $\mathrm{H}_{2} \mathrm{C}=\mathrm{CHR}$, ( $R$ ) enantiomer), 5.10-5.14 (m, $1 \mathrm{H}, \mathbf{H}_{2} \mathrm{C}=\mathrm{CHR}$, ( $S$ ) enantiomer), 5.08-5.10 (m, 1H, $\mathbf{H}_{2} \mathrm{C}=\mathrm{CHR}$, ( $S$ ) enantiomer), 5.03-5.06 ( $\mathrm{m}, 1 \mathrm{H}, \mathbf{H}_{2} \mathrm{C}=\mathrm{CHR},(R)$ enantiomer), 5.00-5.03 ( $\mathrm{m}, 1 \mathrm{H}, \mathbf{H}_{2} \mathrm{C}=\mathrm{CHR},(R)$ enantiomer).

X-ray Structure Determination of 3b. Compound 3b, $\mathrm{C}_{24} \mathrm{H}_{46} \mathrm{O}_{4}$, crystallizes in the monoclinic space group $\mathrm{C} 2 / \mathrm{c}$ (systematic absences $\mathrm{hkl}: \mathrm{h}+\mathrm{k}=$ odd and h 01 : $\mathrm{l}=$ odd) with $\mathrm{a}=22.2227(4) \AA$, $\mathrm{b}=14.6662(2) \AA, \mathrm{c}=14.8727(2) \AA, \mathrm{b}=93.5920(10)^{\circ}, \mathrm{V}=4837.83(13) \AA 3, \mathrm{Z}=8$ and $\mathrm{d}_{\mathrm{calc}}=1.095 \mathrm{~g} / \mathrm{cm} 3$. X-ray intensity data were collected on a Rigaku R-AXIS IIc area detector employing graphitemonochromated Mo-Ka radiation ( $1=0.71069 \AA$ ) at a temperature of $200^{\circ} \mathrm{K}$. Indexing was performed from a series of $1^{\circ}$ oscillation images with exposures of 8 minutes per frame. A hemisphere of data was collected using $10^{\circ}$ oscillation angles with exposures of 15 minutes per frame and a crystal-todetector distance of 82 mm . Oscillation images were processed using bioteX, ${ }^{21}$ producing a listing of unaveraged $\mathrm{F}^{2}$ and $\sigma\left(\mathrm{F}^{2}\right)$ values which were then passed to the teXsan ${ }^{22}$ program package for further processing and structure solution on a Silicon Graphics O2 computer. A total of 18456 reflections were measured over the ranges $5.48 \leq 2 \theta \leq 50.68^{\circ}$, $-26 \leq h \leq 26,-17 \leq k \leq 17,-16 \leq 1 \leq 17$ yielding 4378 unique reflections ( $\mathrm{R}_{\mathrm{int}}=0.0285$ ). The intensity data were corrected for Lorentz and polarization effects but not for absorption.

The structure was solved by direct methods (SIR92 ${ }^{23}$ ). The alkyl chain C22-C23-C24 chain was disordered by a rotation about the C9-C21 bond; the two contributing disorder models had relative populations of 70:30. Refinement was by full-matrix least squares based on $\mathrm{F}^{2}$ using SHELXL-93. ${ }^{24}$ All reflections were used during refinement ( $\mathrm{F}^{2}$ 's that were experimentally negative were replaced by $\left.\mathrm{F}^{2}=0\right)$. The weighting scheme used was $\mathrm{w}=1 /\left[\mathrm{\sigma} 2\left(\mathrm{~F}_{\mathrm{o}}{ }^{2}\right)+0.0617 \mathrm{P}^{2}+5.3153 \mathrm{P}\right]$ where $\mathrm{P}=\left(\mathrm{F}_{\mathrm{o}}{ }^{2}+2 \mathrm{~F}_{\mathrm{c}}{ }^{2}\right.$ )/3. Non-hydrogen atoms were refined anisotropically and hydrogen atoms were refined using a
"riding" model except for the two hydroxyl hydrogens which were included as constant contributions to the structure factors and were not refined. Refinement converged to $R_{1}=0.0634$ and $w R_{2}=0.1552$ for 4079 reflections for which $F>4 \sigma(F)$ and $R_{1}=0.0689, w_{2}=0.1590$ and $G O F=1.167$ for all 4378 unique, non-zero reflections and 287 variables. ${ }^{25}$ The maximum $\Delta / \sigma$ in the final cycle of least squares was 0.013 and the two most prominent peaks in the final difference Fourier were +0.353 and -0.450 e / $\AA^{3}$.

Table S1 lists cell information, data collection parameters, and refinement data. Final positional and equivalent isotropic thermal parameters are given in Table S2. Anisotropic thermal parameters are in Table S3. Tables S4 and S5 list bond distances and bond angles. Figure S1 is an ORTEP ${ }^{26}$ representation of the molecule with $30 \%$ probability thermal ellipsoids displayed.

Figure S1. ORTEP drawing of 3b with $30 \%$ probability thermal ellipsoids.
