General. All solvents were distilled prior to use. Diethyl ether and tetrahydrofuran were distilled from sodium/benzophenone. Dichloromethane, benzene, toluene and triethylamine were destilled from $\mathrm{CaH}_{2}$. All reactions were carried out in oven-dried or flame-dried glassware and under argon unless water was used as a reaction medium. Commercially available compounds were used as received unless otherwise indicated. Potassium and sodium hexamethyldisilazide (KHMDS, NaHMDS) were purchased as stock solutions ( 0.5 M in toluene and 0.6 M in hexane, respectively) and titrated according to the method of Ireland and Meissner. ${ }^{1}$ 18-Crown- 6 was recrystallized from anhydrous acetonitrile and dried under vacuum. TLC analyses were performed on Merck aluminum-backed F254 silica gel plates, using UV light and a solution of 5\% phosphomolybdic acid in ethanol for visualization. Flash chromatography was performed as described by Still and coworkers ${ }^{2}$ using Amicon Matrex $60 \AA ̊$ silica gel ( $35-70 \mu$ ). Ozonolysis was performed with a Fischer OZ 500 Ozone Generator. Enantiomeric excesses were determined by a Varian 9012 HPLC using a Chiralcel ODH column. NMR spectra were recorded in $\mathrm{CDCl}_{3}$ unless otherwise indicated, using $\mathrm{CHCl}_{3}(\delta 7.27 \mathrm{ppm})$ and $\mathrm{CDCl}_{3}(\delta 77.0 \mathrm{ppm})$ as internal references for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, respectively. Optical rotations were determined on a Perkin Elmer 241 Polarimeter. GC/MS was performed on a Hewlett Packard 5890A gas chromatograph coupled to a VG MASSLAB automated mass spectrometer. IR spectra were recorded on neat samples using AgCl plates. Microanalyses were performed by the Microanalysis Laboratory, Institute of Physical Chemistry, University of Vienna, Austria.

Phosphonate 3b. To a solution of diethylphosphonoacetic acid ( $156.0 \mathrm{mg}, 0.80 \mathrm{mmol}$ ) in 15 mL of dry benzene at $0{ }^{\circ} \mathrm{C}$ was added oxalylchloride ( $150 \mu \mathrm{~L}, 1.75 \mathrm{mmol}$ ). The solution was stirred overnight and slowly allowed to warm up to room temperature. The solution was concentrated and the residue dissolved in 9 mL dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. In a separate flask, $(S, S)-2,3-$ diphenylaziridine ${ }^{3}(152.6 \mathrm{mg}, 0.78 \mathrm{mmol})$ was dissolved in 15 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{Et}_{3} \mathrm{~N}(120 \mu \mathrm{~L}$, 0.86 mmol ) was added. The phosphonate solution was added slowly to the aziridine solution and the reaction mixture was stirred at $-20^{\circ} \mathrm{C}$ for 1.5 h followed by 1 h at $0^{\circ} \mathrm{C}$. Concentration and
purification by flash chromatography $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ afforded $227.6 \mathrm{mg}(78 \%)$ of phosphonate $\mathbf{3 b}$ as a colorless oil. 3b: ${ }^{1} \mathrm{H}$ NMR ( 250 MHz ) $\delta 7.40-7.21(\mathrm{~m}, 10 \mathrm{H}), 4.21-4.09(\mathrm{~m}, 4 \mathrm{H}), 3.89(\mathrm{~s}, 2 \mathrm{H})$, $2.78(\mathrm{dd}, J=18.0,14.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.69(\mathrm{dd}, J=18.0,14.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.39-1.22(\mathrm{~m}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $(50.3 \mathrm{MHz}) \delta 172.2,134.8,128.6,128.2,126.1,62.7\left(\mathrm{~d}, J_{P C}=6 \mathrm{~Hz}\right), 62.2\left(\mathrm{~d}, J_{P C}=6 \mathrm{~Hz}\right), 48.5$, $37.4\left(\mathrm{~d}, J_{P C}=132 \mathrm{~Hz}\right), 16.2\left(\mathrm{~d}, J_{P C}=5 \mathrm{~Hz}\right), 16.1\left(\mathrm{~d}, J_{P C}=5 \mathrm{~Hz}\right)$; IR 3470, 2985, 1690, 1604, 1498, 1464, 1422, 1360, 1332, 1257, 1163, 1027, 970, 755, $699 \mathrm{~cm}^{-1} ; \mathrm{m} / \mathrm{z} 373$ ([M+], 30\%), 195 $(50 \%), 194(100 \%), 130(37 \%) ;[\alpha]_{\mathrm{D}}=-66.3\left(c 1.16, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. Phosphonate 3a. Prepared in $72 \%$ yield by an analogous procedure, using $(R, R)-2,3-$ diphenylaziridine instead. 3a: Spectral data identical with those obtained for 3b. $[\alpha]_{\mathrm{D}}=+66.3$ (c 1.08, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). Anal. Calcd for $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{NO}_{4} \mathrm{P}: \mathrm{C}, 64.34 ; \mathrm{H}, 6.48 ; \mathrm{N}, 3.75$. Found: C, 64.49; H, 6.71; N, 3.73.

General Procedure for the Asymmetric Horner-Wadsworth-Emmons Reactions. To a solution of the phosphonate(s) (0.50-0.55 equiv of each) and 18-crown-6 (when KHMDS was used as base; 2.5 equiv in the standard kinetic resolutions, 5.0 equiv in the PKR experiments) in THF ( 0.02 M with respect to the combined amount of phosphonate) at $-78^{\circ} \mathrm{C}$ under argon was added KHMDS or NaHMDS ( 0.5 M in toluene or 0.6 M in hexane, respectively; 0.50 equiv in the standard kinetic resolutions, 1.0 equiv in the PKR experiments). After 30 min , the resulting solution was added via cannula to a precooled $\left(-78^{\circ} \mathrm{C}\right)$ solution of the aldehyde (1.0-1.1 equiv) in THF. The reaction mixture was stirred for $2-6 \mathrm{~h}$ at $-78^{\circ} \mathrm{C}$ and then quenched with a 1 M solution of acetic acid in methanol followed by phosphate buffer ( pH 7 ). After 5 min , the reaction mixture was warmed to room temperature. Extractive workup (EtOAc or $\left.\mathrm{Et}_{2} \mathrm{O}\right)$, drying $\left(\mathrm{MgSO}_{4}\right)$ and concentration gave the crude condensation products. Further purification was generally performed by chromatography, as detailed below.

In order to determine the absolute configurations at the allylic stereocenter of alkenes ( $S, Z$ )10 and $(R, E)-10$, both compounds were converted to lactam 13 as described below. In the first step, $(S, Z)$-10 undergoes substitution with inversion of both the allylic stereocenter and the alkene geometry, while $(R, E)$ - $\mathbf{1 0}$ reacts with retention of both the allylic stereocenter and the alkene geometry. ${ }^{9}$

Lactam $(R)-16$ has been reported to have $[\alpha]_{\mathrm{D}}=+9.0\left(\mathrm{c} 2.0, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)(>99 \% e e) .{ }^{11}$ Thus, the rotation measured by us for lactam 15 indicates by analogy that it has $(R)$-configuration. Furthermore, the absolute configurations assigned for $(S, Z) \mathbf{- 1 0}$ and $(R, E)-\mathbf{1 0}$ are consistent with the absolute configurations determined for products obtained from asymmetric HWE reactions of aldehydes structurally similar to 9 .
