

X-Ray Structure determination of (E)-7, (EE)-12b. Data were measured using the ω - 2θ scan technique with a scan angle of 1.5° and a variable scan rate with a maximum scan time of 60 s per reflection. Mo $K\alpha$ radiation was used with a graphite-crystal monochromator on a Nonius CAD4 single-crystal diffractometer. On all reflections, profile analysis was performed.¹ Multiple measured reflections were averaged and Lorentz and polarization corrections were applied. The structures were solved by Patterson methods using DIRDIF99.² Isotropic least-squares refinement on F^2 using SHELXL97.³ During the final stages of the refinements, all positional parameters and the anisotropic temperature factors of all the non-H atoms were refined. The H-atoms were refined isotropically as a mixture of independent and constrained refinement. A statistical disordered model accounting for BF_4^- and CH_2Cl_2 groups was refined for structure (EE)-12b. Atomic scattering factors were taken from International tables for X-ray Crystallography.⁴ Plots were made with the PLATON package.⁵ Geometrical calculations were made with PARST⁶. Publication Material were made with WinGX.⁷ All calculations were made on the Scientific Computer Centre at the University of Oviedo.
