## Competitive Radioligand Binding Assay.

The affinity of compounds for the human GnRH receptor was determined by a competitive displacement of the GnRH receptor radioligand, $\left[{ }^{125} \mathrm{I}-\mathrm{Tyr}^{5}\right.$, $\mathrm{DLeu}^{6}$, $\mathrm{NMeLeu}^{7}$, $\mathrm{Pro}^{9}$-NEt]GnRH. HEK293 cells stably transfected with the full-length human GnRH receptor (REF) were harvested, resuspended in $5 \%$ sucrose and homogenized using a polytron homogenizer ( $2 \times 15$ sec). ${ }^{8}$ Nuclei were removed by centrifugation ( 3000 xg for 5 min .), and the supernatant centrifuged ( $20,000 \mathrm{xg}$ for $30 \mathrm{~min}, 4^{\circ} \mathrm{C}$ ) to collect the membrane fraction. The final membrane preparation was resuspended in binding buffer ( 10 mM Hepes ( pH 7.5 ), 150 mM NaCl , and $0.1 \%$ BSA) and stored at $-70^{\circ} \mathrm{C}$. Binding reactions were performed in a Millipore MultiScreen 96-well filtration plate assembly with polyethylenimine coated GF/C membranes. The reaction were initiated by adding membranes ( 25 ug protein in 130 ul binding buffer) to 50 ul of $\left[{ }^{125}\right]$-labeled GnRH peptide ( $\sim 100,000 \mathrm{cpm}$ ), and 20 ul of competitor at varying concentrations. The reaction was terminated after 90 minutes by filtration and washing (2X) with phosphate buffered saline. Bound radioactivity was measured by removing the filters from the plate and direct gamma counting. $\mathrm{K}_{\mathrm{i}}$ values were calculated from competition binding data using non-linear least squares regression by use of the Prism software package (GraphPad Software) with the Cheng Prusoff equation. ${ }^{1}$

## Inhibition of GnRH-stimulated $\mathrm{Ca}^{++}$Flux.

Functional activity of compounds for the human GnRH receptor was determined by inhibition of GnRH stimulated $\mathrm{Ca}^{++}$flux. RBL cells stably expressing the full-length human GnRH receptor were seeded into 96-well, black wall clear bottom plates (Corning) at a density of 50,000 cells/well and the cells allowed to attach overnight. Cells were then loaded with the $\mathrm{Ca}^{++}$ sensitive dye, Fluo-4 (Molecular Probes), by incubation in loading medium [(DMEM with 20 mM Hepes, $10 \% \mathrm{FBS}, 2 \mu \mathrm{M}$ Fluo-4, $0.02 \%$ pluronic acid (Molecular Probes) and 2.5 mM probenecid (Sigma)] for 1 hour at $37^{\circ} \mathrm{C}$. Cells were then washed 3 times with assay buffer (Hanks balanced salt, 20 mM Hepes, 2.5 mM probenecid). Compounds at varying concentrations in assay buffer were pre-incubated with cells for 1 minute prior to stimulation with GnRH (5 $\mathrm{nM})$. Measurement of fluorescence due to GnRH stimulated $\mathrm{Ca}^{++}$flux was performed according to the manufacturer's instructions on the FLIPR system (Molecular Devices, FLIPR ${ }^{384}$ system). $\mathrm{IC}_{50}$ values for the inhibition of GnRH -stimulated $\mathrm{Ca}^{++}$flux were calculated using the Prism
software package (GraphPad Software) with a "sigmoidal dose-response (variable slope)" option for curve fitting.
