I. General

NMR spectra were recorded on a Varian Mercury Vx400 spectrometer in solvents as indicated. Chemical shifts (δ) are given in ppm relative to TMS. The residual solvent signals were used as references and the chemical shifts converted to the TMS scale (CDCl_3 : $\delta_{\text{H}} = 7.26$ ppm, $\delta_{\text{C}} = 77.16$ ppm; CD_3OD : $\delta_{\text{H}} = 3.31$ ppm, $\delta_{\text{C}} = 49.00$ ppm; $d_6\text{-DMSO}$: $\delta_{\text{H}} = 2.50$ ppm, $\delta_{\text{C}} = 39.52$ ppm). Infrared spectra were obtained on a Bio-Rad FTS-185 instrument. Mass spectra were provided on Agilent 5973 or Agilent 1100 instruments. All melting points were uncorrected. $[\text{Cp}^*\text{RhCl}_2]_2$ was purchased from Strem. All other reagents were from commercial sources. No attempts were made to optimize yields for substrate synthesis.

II. Synthesis of *N*-Methoxy Amides 1

General Procedure:

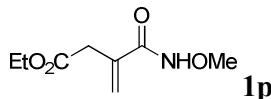

The *N*-methoxy amides 1 were prepared following a published procedure¹: In a reaction flask, drops of DMF were added to the solution of acid (1 equiv) in DCM (0.25 M). The resulting solution was cooled to 0 °C followed by dropwise addition of oxalyl chloride (1.2 equiv). The reaction was allowed to warm to room temperature and stirred for 12 h. Afterwards, the solvent was removed under reduced pressure to afford the corresponding acyl chloride.

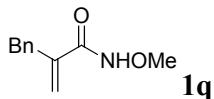

In a reaction flask, a mixture of $\text{MeONH}_2 \cdot \text{HCl}$ (1.5 equiv) and K_2CO_3 (2 equiv) in a 2:1 mixture of $\text{EtOAc:H}_2\text{O}$ (0.3 M) was stirred at 0 °C, followed by dropwise addition of the acyl chloride obtained above. The reaction was stirred at room temperature until completion. Afterwards, the reaction was quenched with aqueous NaHCO_3 solution and extracted with EtOAc (x3). The organic phase was washed with brine, dried over MgSO_4 , filtered and evaporated under reduced pressure. The crude product was purified by flash column chromatography on silica gel or recrystallization from EtOAc/PE to give the desired *N*-methoxy amides 1.

V. Further Investigation on the Effect of Hydroxy Group in the Allenes

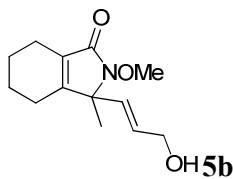

Without any particular precautions to extrude oxygen or moisture, *N*-methoxy amide **1** (0.2 mmol, 1 equiv), the allene derivative **4** (0.4 mmol, 2 equiv), [Cp*RhCl₂]₂ (3.2 mg, 0.005 mmol, 2.5 mol %) and AgOAc (66.8 mg, 0.4 mmol, 2 equiv) were weighted in a 10 mL sealed tube equipped with a stir bar. CH₃CN (0.1 M) was then added. The reaction was stirred at room temperature or 80 °C and monitored by TLC until completion. Afterwards, the reaction mixture was diluted with EtOAc and transferred to a round bottom flask. Silica gel was added to the flask and volatiles were evaporated under reduced pressure. The purification was performed by flash column chromatography on silica gel (see below for specific eluents).
