## Table of contents

1. General information ..... 2
2. General procedure for the total synthesis of fluorescent probe Fluo-CQ (6). ..... 3
3. NMR Spectra of compounds $\mathbf{2 , 3}, \mathbf{4}, 5,6$ and $\mathbf{7}$ ..... 8
4. Physico-Chemistry (materials and methods) ..... 20
5. Antimalarial Properties ..... 36

## I. GENERAL INFORMATION

Solvents and reagents: Commercially available starting materials were purchased from SigmaAldrich, ABCR GmbH \& Co. KG, Alfa Aesar, and Apollo Scientific and were used without further purification. Solvents were obtained from Sigma-Aldrich and Carlos Erba; unless noticed reagent grade was used for reactions and column chromatography (analytical grade) was used for recrystallizations. When specified, anhydrous solvents were required; dichloromethane (DCM) was distilled over $\mathrm{CaH}_{2}$ under argon. Tetrahydrofuran (THF) was distilled over sodium/benzophenone under argon or dried by passage through an activated alumina column under argon. 1,4-Dioxane and dimethylformamide (DMF) were purchased anhydrous over molecular sieves from Sigma-Aldrich. All reactions were performed in standard glassware. Thin Layer Chromatography (TLC) were used to monitor reactions (vide infra). Crude mixtures were purified either by recrystallization or by flash column chromatography. The latter were performed using silica gel 60 (230-400 mesh, 0.040-0.063 mm ) purchased from E. Merck. Automatic flash chromatographies were carried out in a Biotage Puriflash apparatus with UV-Vis detection at 254 nm (unless otherwise specified). Flash chromatography was performed using silica gel G60 (230-400 mesh) from Macherey Nagel. Monitoring and primary characterization of products were achieved by Thin Layer Chromatography on aluminium sheets coated with silica gel 60 F254 purchased from E. Merck. Eluted TLC's were revealed under UV ( 325 nm and 254 nm ) and with chemicals.

Nuclear Magnetic Resonance (NMR) The Nuclear Magnetic Resonance (NMR) spectra were registered in a Bruker (Bruker DRX-300) avance 300 apparatus ( ${ }^{1} \mathrm{H}$ NMR $300 \mathrm{MHz},{ }^{13} \mathrm{C}$ NMR 75 MHz ) at the ECPM. Bruker avance 400 apparatus was used ( ${ }^{1} \mathrm{H}$ NMR $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ NMR 100 MHz ) for more complex spectra at the ECPM. All chemical shifts ( $\delta$ ) are quoted in parts per million (ppm) relative to TMS. The chemical shifts are referred to the used partial deuterated NMR solvent (for $\mathrm{CDCl}_{3}:{ }^{1} \mathrm{H}$ NMR, 7.27 ppm and ${ }^{13} \mathrm{C}$ NMR, 77.16 ppm ). The coupling constants $(J)$ and the nonequivalence ( $\Delta v$ ) are given in Hertz (Hz). Resonance patterns are reported with the following notations: br (broad), s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), dd (doublet of doublets). In addition, the following acronyms will be used: $\mathrm{C}_{\mathrm{q}}$ : quaternary carbon; $\mathrm{CH}_{2}$ : secondary carbon; $\mathrm{CH}_{3}$ : methyl group.

Microanalyses : Microanalyses were obtained at "Service de Microanalyses" at the institut de chimie de Strasbourg. Mass spectrometry: Mass spectra (ESI-MS) were obtained on a microTOF LC spectrometer (Bruker Daltonics, Bremen). High Resolution Mass (HRM) spectra were measured and fitted with calculated data. Melting point Melting points were determined on a Büchi melting point apparatus and were not corrected. Infrared spectroscopy. Infra red (IR) spectra were recorded on a diamond ATR spectrometer using neat samples. Infrared frequencies are reported in wave-
numbers ( $\mathrm{cm}-1$ ), intensities were determined qualitatively and are indicated as vs (very strong), s (strong), $m$ (medium), $w$ (weak), b (broad).

## II. GENERAL PROCEDURE FOR THE TOTAL SYNTHESIS OF FLUO-CQ (6)

## 1. Synthesis of $\boldsymbol{N}^{I}$-(7-chloroquinolin-4-yl)ethane-1,2-diamine (1)

A mixture of 4,7-dichloroquinoline ( $15 \mathrm{~g}, 75.74 \mathrm{mmol}, 1 \mathrm{eq}$.$) , and ethylenediamine ( 20.3 \mathrm{~mL}, 303$ mmol, 4 eq.) was stirred at $80-90^{\circ} \mathrm{C}$ for 3.5 hours under Argon and then cooled to room temperature. A solution of $1 \mathrm{~N} \mathrm{NaOH}(150 \mathrm{~mL})$ was added and the mixture was extracted with a solution of DCM/ $\mathrm{MeOH}(8 / 2)\left(4 \times 100 \mathrm{~mL}\right.$ ), dried over $\mathrm{MgSO}_{4}$ and concentrated under vacuum (Crude: 11.2 g ). The crude was recrystallized from ethanol to afford the desired compound (1) as a White solid ( 7.47 g ) Yield 44 \%.
$\mathbf{R f}=0.06$ (eluent: $\mathrm{DCM} / \mathrm{MeOH}, 8 / 2$ at $10 \%$ in Triethylamine)
${ }^{1} \mathbf{H}$ NMR ( $\mathbf{4 0 0} \mathbf{~ M H z}, \mathbf{C D}_{3} \mathbf{O D}$ ): $\delta 8.36(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 8.13(\mathrm{~d}, J=9.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.78$ (d, $J=2.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.40(\mathrm{dd}, J=2.2,9.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 6.57(\mathrm{~d}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 3.46(\mathrm{t}$, $\left.J=6.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.98\left(\mathrm{t}, J=6.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$.
${ }^{13}$ C NMR ( $\mathbf{1 0 0} \mathbf{~ M H z , ~}$ CD $_{\mathbf{3}} \mathbf{O D}$ ): $\delta 152.8\left(\mathrm{C}_{\mathrm{q}}\right), 152.5\left(\mathrm{C}_{\mathrm{q}}\right), 149.7(\mathrm{CH}), 136.4\left(\mathrm{C}_{\mathrm{q}}\right), 127.6(\mathrm{CH}), 126.0$ $(\mathrm{CH}), 124.3(\mathrm{CH}), 118.8\left(\mathrm{C}_{\mathrm{q}}\right), 99.7(\mathrm{CH}), 46.3\left(\mathrm{CH}_{2}\right), 40.9\left(\mathrm{CH}_{2}\right)$.

## 2. Synthesis of $N^{I}$-(7-chloroquinolin-4-yl)- $N^{2}$-isopropylethane-1,2-diamine (3)

A mixture of acetone ( $0.796 \mathrm{~mL}, 10.8 \mathrm{mmol}, 2.4$ eq.) , titanium tetraisopropoxide $(2.7 \mathrm{~mL}, 9.02 \mathrm{mmol}$, $2 \mathrm{eq})$ and primary amine ( $\mathbf{1}$ ) ( $1 \mathrm{~g}, 4.51 \mathrm{mmol}, 1$ eq.) in absolute $\mathrm{EtOH}(7 \mathrm{~mL})$ was stirred for 7 h at room temperature under argon. Then $\mathrm{NaBH}_{4}(0.256 \mathrm{~g}, 6.77 \mathrm{mmol}, 1.5 \mathrm{eq}$.) was added and the resulting mixture was stirred for 17 h . The mixture was slowly poured into 13.5 mL of a $2 \mathrm{M} \mathrm{NH} 4 \mathrm{~N}_{4} \mathrm{OH}$ solution. The resulting white inorganic precipitate was filtered and washed with DCM ( 20 mL ). Phases were separated and the water layer was extracted with DCM ( 20 mL ). The combined organic layers were extracted with 10 mL of a 1 N HCl solution. The acidic layer was washed with DCM $(20 \mathrm{~mL})$ then treated with 2 N NaOH solution to reach $\mathrm{pH} 10-12$ and extracted with DCM ( $3 \times 20 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum to afford the product (2) as colorless oil ( 1.09 g ). Yield $92 \%$.
$\mathbf{R f}=0.5$ (eluent: $\mathrm{DCM} / \mathrm{MeOH}, 8 / 2$ at $5 \%$ in triethylamine)
${ }^{\mathbf{1}} \mathbf{H}$ NMR (400 MHz, CD $\left.\mathbf{3}_{\mathbf{3}} \mathbf{O D}\right): \delta 8.35(\mathrm{~d}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H} \mathrm{Qn} H), 8.08(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.77$ $(\mathrm{d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.39(\mathrm{dd}, J=2.1,9.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 6.56(\mathrm{~d}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 3.48(\mathrm{t}$, $\left.J=6.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.91(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}), 2.86(\mathrm{sept}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 1.09(\mathrm{~d}, J=6.0$ $\mathrm{Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}$ )
${ }^{13} \mathbf{C}$ NMR (100 MHz, CD $\left._{\mathbf{3}} \mathbf{O D}\right): \delta 152.7\left(\mathrm{C}_{\mathrm{q}}\right), 152.5\left(\mathrm{C}_{\mathrm{q}}\right), 149.7(\mathrm{CH}), 136.3\left(\mathrm{C}_{\mathrm{q}}\right), 127.6(\mathrm{CH}), 126.1$ $(C H), 124.3(C H), 118.8\left(\mathrm{C}_{\mathrm{q}}\right), 99.7(\mathrm{CH}), 49.8(\mathrm{CH}), 46.0\left(\mathrm{CH}_{2}\right), 43.6\left(\mathrm{CH}_{2}\right), 22.5\left(\mathrm{CH}_{3}\right)$.
3. Synthesis of tert-butyl (2-((2-((7-chloroquinolin-4-yl)amino)ethyl)(isopropyl)amino)-2oxoethyl)carbamate (2)

To a solution of Boc-Glycine ( $1 \mathrm{~g}, 5.68 \mathrm{mmol}, 1.5 \mathrm{eq}$.$) and amine ( 2$ ) ( $1 \mathrm{~g}, 3.79 \mathrm{mmol}, 1 \mathrm{eq}$.) in DCM $(20 \mathrm{~mL})$ were added $\mathrm{HBTU}(1.44 \mathrm{~g}, 3.79 \mathrm{mmol}, 1 \mathrm{eq}$.$) and EDC ( 0.69 \mathrm{~mL}, 3.79 \mathrm{mmol}, 1 \mathrm{eq}$.$) . The$ mixture was stirred for 3 days. Then, 1 eq. of Boc-Glycine was added. The mixture was stirred for 1 day. Then water ( 10 mL ) and 10 mL of 1 N NaOH solution were added. Phases were separated and the water layer was extracted with DCM ( $3 \times 15 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum (crude: 3 g ). The crude was purified with a silica gel column chromatography (eluent: AcOEt/ $\mathrm{MeOH}, 9 / 1$ ). The product (3) was obtained as a White solid ( 1.29 g ). Yield $90 \%$.
$\mathbf{R f}=0.61$ (eluent: $\mathrm{DCM} / \mathrm{MeOH}, 9 / 1$ )
$\mathbf{M p}=178-180^{\circ} \mathrm{C}$
${ }^{1} \mathbf{H}$ NMR ( $\mathbf{3 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ) : $\delta 8.48(\mathrm{~d}, J=5.43 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.93(\mathrm{~d}, J=2.20 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.76$ $(\mathrm{d}, J=9.02 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.38(\mathrm{dd}, J=8.88 \mathrm{~Hz}$ and $J=2.21 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 6.29(\mathrm{~d}, J=5.49 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{Qn} H), 5.56\left(\mathrm{bs}, 1 \mathrm{H}, \mathrm{CH}_{2}\right), 4.10-4.03\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}+\mathrm{NH}\right), 3.99(\mathrm{sept}, 1 \mathrm{H}, \mathrm{CH}), 3.75-3.71\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, 3.45-3.40 (m, 2H, CH2 $), 2.53(\mathrm{bs}, 1 \mathrm{H}, \mathrm{NH}), 1.46\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{CH}_{3}\right), 1.27\left(\mathrm{~d}, J=6.74 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right)$.
${ }^{13} \mathbf{C}$ NMR (75 MHz, $\left.\mathbf{C D C l}_{3}\right): \delta 171.08\left(\mathrm{C}_{\mathrm{q}}\right), 155.89\left(\mathrm{C}_{\mathrm{q}}\right), 151.67(\mathrm{CH}), 150.32\left(\mathrm{C}_{\mathrm{q}}\right), 148.74\left(\mathrm{C}_{\mathrm{q}}\right)$, $135.17\left(\mathrm{C}_{\mathrm{q}}\right), 128.25(\mathrm{CH}), 125.25(\mathrm{CH}), 122.18(\mathrm{CH}), 117.30\left(\mathrm{C}_{\mathrm{q}}\right), 98.17(\mathrm{CH}), 80.11\left(\mathrm{C}_{\mathrm{q}}\right), 48.19(\mathrm{CH})$, $45.71\left(\mathrm{CH}_{2}\right), 42.86\left(\mathrm{CH}_{2}\right), 39.82\left(\mathrm{CH}_{2}\right), 28.51\left(\mathrm{CH}_{3}\right), 21.25\left(\mathrm{CH}_{3}\right)$.

IR : 3370 (w), 2972 (w), 1697 (m), 1662 (s), 1580 (vs), 1537 (m), 1427 (m), 1370 (m), 1290 (s), 1161 (s), 1051 (m), 854 (m), 812 (m), 766 (m).

## 4. Synthesis of tert-butyl (2-((2-((7-chloroquinolin-4yl)amino)ethyl)(isopropyl)amino)ethyl) carbamate (4)

To a solution of the protected amine (3) ( $1.9 \mathrm{~g}, 4.51 \mathrm{mmol}$, 1 eq.) in anhydrous THF ( 10 mL ) under reflux was added dropwise a 2 M borane-methyl sulfide complex solution in THF ( $5.64 \mathrm{~mL}, 11.3$ $\mathrm{mmol}, 2.5 \mathrm{eq}$.). The mixture was stirred for 35 minutes under reflux. The mixture was poured into 50 mL of a 3 M HCl solution and 75 mL of a 3 M NaOH solution were added. The mixture was extracted with DCM ( $3 \times 100 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum (crude: 1.95 g ). The crude was purified on an automatic silica column chromatography (eluent: $\mathrm{CHCl}_{3} / \mathrm{MeOH}$, gradient: ( $100 / 0$-> $90 / 10$ ). The product was obtained as colorless oil ( 500 mg ). The product (4) was precipitated from petroleum ether. The product was obtained as colorless oil ( 487 mg ). Yield $60 \%$.
$\mathbf{R f}=0.49$ (eluent: $\mathrm{DCM} / \mathrm{MeOH}, 9 / 1$ )
${ }^{1} \mathbf{H}$ NMR ( $\mathbf{3 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 8.52(\mathrm{~d}, J=5.32 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.94(\mathrm{~d}, J=2.21 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.71$ (d, $J=9.01 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.35(\mathrm{dd}, J=9.07 \mathrm{~Hz}$ and $J=2.44 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 6.35(\mathrm{~d}, J=5.33 \mathrm{~Hz}, 1 \mathrm{H}$, Qn $H$ ), 5.94 (bs, $1 \mathrm{H}, \mathrm{N} H$ ), 4.76 (bs, $1 \mathrm{H}, \mathrm{NH}$ ), 3.28-3.23 (m, 2H, CH ${ }_{2}$ ), 3.19-3.13 (m, 2H, CH2), 3.01 (sept, $1 \mathrm{H}, \mathrm{CH}$ ), 2.83-2.79 (m, 2H, CH2 $), 2.61-2.57\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.30\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{CH}_{3}\right), 1.05(\mathrm{~d}, J=6.65$ $\mathrm{Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}$ ).
${ }^{13} \mathbf{C}$ NMR ( 75 MHz, CDCl $_{3}$ ): $\delta 156.18\left(\mathrm{C}_{\mathrm{q}}\right), 152.24(\mathrm{CH}), 149.90\left(\mathrm{C}_{\mathrm{q}}\right), 149.34\left(\mathrm{C}_{\mathrm{q}}\right), 134.88\left(\mathrm{C}_{\mathrm{q}}\right)$, $128.91(\mathrm{CH}), 125.50(\mathrm{CH}), 121.31(\mathrm{CH}), 117.63\left(\mathrm{C}_{\mathrm{q}}\right), 99.48(\mathrm{CH}), 79.43\left(\mathrm{C}_{\mathrm{q}}\right), 50.38(\mathrm{CH}), 49.56$ $\left(\mathrm{CH}_{2}\right), 47.88\left(\mathrm{CH}_{2}\right), 40.57\left(\mathrm{CH}_{2}\right), 39.99\left(\mathrm{CH}_{2}\right), 28.40\left(\mathrm{CH}_{3}\right), 18.31\left(\mathrm{CH}_{3}\right)$.

IR: 3349 (w), 2967 (w), 2928 (w), 2852 (w), 1693 (m), 1579 (vs), 1522 (m), 1364 (m), 1280 (m), 1248 (m), 1167 (s), 1137 (m), 1080 (m), 875 (w), 805 (w).

Elemental analysis: calcd (\%) for $\mathrm{C}_{21} \mathrm{H}_{31} \mathrm{ClN}_{4} \mathrm{O}_{2}$ : $\mathrm{N}, 13.63$; C, 62.11; H, 7.62; found $\mathrm{N}, 13.77$; C , 61.98; H, 7.68.

HRMS-ESI ( $\mathbf{m} / \mathbf{z}$ ): $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{21} \mathrm{H}_{32} \mathrm{ClN}_{4} \mathrm{O}_{2} 407.2184$; found 407.2202.
5. Synthesis of $N^{1}$-(2-aminoethyl)- $N^{2}$-(7-chloroquinolin-4-yl)- $N^{1}$-isopropylethane-1,2diamine (5)

To a solution of the protected amine (4) ( $100 \mathrm{mg}, 0.246 \mathrm{mmol}, 1 \mathrm{eq}$.) in ether ( 5 mL ) was added HCl $6 \mathrm{~N}(2 \mathrm{~mL}, 12 \mathrm{mmol}, 48.8$ eq.). The mixture was stirred for 30 min at room temperature. A 1 N NaOH solution was added until a white precipitate appears. The mixture was extracted with DCM (3 x 10 mL ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum to afford pure product (5) quantitatively as colorless oil compound ( 75.4 mg ). Yield $100 \%$

The compound was involved directly in the next step (peptide coupling reaction) without further purification.
${ }^{1} \mathbf{H}$ NMR ( $300 \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ) : $\delta 8.40(\mathrm{~d}, J=5.65 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.90(\mathrm{~d}, J=8.97 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.85$ $(\mathrm{d}, J=2.45 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 7.29(\mathrm{dd}, J=9.03 \mathrm{~Hz}$ and $J=2.17 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Qn} H), 6.32(\mathrm{~d}, J=5.98 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{Qn} H), 3.32-3.28\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.99(\mathrm{sept}, 1 \mathrm{H}, \mathrm{CH}), 2.85-2.77\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 2.64-2.60\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.03\left(\mathrm{~d}, J=6.56 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right)$.
${ }^{13} \mathbf{C}$ NMR (300 MHz, $\left.\mathbf{C D C l}_{3}\right): \delta 152.1(\mathrm{CH}), 150.2\left(\mathrm{C}_{\mathrm{q}}\right), 149.3\left(\mathrm{C}_{\mathrm{q}}\right), 134.8\left(\mathrm{C}_{\mathrm{q}}\right), 128.7(\mathrm{CH}), 125.2$ $(C H), 121.8(C H), 117.7\left(\mathrm{C}_{q}\right), 99.3(C H), 52.1\left(\mathrm{CH}_{2}\right), 50.3\left(\mathrm{CH}_{2}\right), 47.7\left(\mathrm{CH}_{2}\right), 41.0\left(\mathrm{CH}_{2}\right), 40.9\left(\mathrm{CH}_{2}\right)$, $18.2\left(\mathrm{CH}_{3}\right)$.
IR: 3279 (w), 2963 (w), 2920 (w), 2850 (w), 1578 (vs), 1450 (m), 1366 (m), 1329 (m), 1137 (m), 1079 (m), 875 (m), 804 (m), 767 (m).

## 6. Synthesis of the Key intermediate: 6-((7-nitrobenzo[c][1,2,5]oxadiazol-4yl)amino)hexanoic acid (7) ${ }^{1}$

As described by Elliot and Prestwich, ${ }^{2}$ NBD-6-aminohexanoic acid (7) was obtained by an economical nucleophilic substitution between 6-aminohexanoic acid and NBD-chloride in the presence of excess of sodium bicarbonate (3 equiv., eq. 38) in $77 \%$ of yield.

Sodium bicarbonate ( $2.52 \mathrm{~g}, 30.0 \mathrm{mmol}, 3 \mathrm{eq}$. ) and 6-aminohexanoic acid ( $2.64 \mathrm{~g}, 20.0 \mathrm{mmol}, 2 \mathrm{eq}$.) were added to $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$. 4-chloro-7-nitrobenzofurazan ( $2.0 \mathrm{~g}, 10.0 \mathrm{mmol}, 1 \mathrm{eq}$.) dissolved in $\mathrm{MeOH}(80 \mathrm{~mL})$ was added and the mixture was stirred at $60^{\circ} \mathrm{C}$ for 30 min . The solution was cooled in ice, acidified to pH 2.0 with concentrated HCl , and the MeOH was removed by rotary evaporation. Excess water ( 200 mL ) was added and the suspension was homogeneously dispersed by bath sonication. A fine black powder was collected by filtration, washed with water, and dried under vacuum to give the desired compound as a white solid product. The crude NBD-6-aminohexanoic acid (7) was isolated with 2.26 g as a black solid ( $77 \%$ yield) in good purity.

Mp: $159-161^{\circ} \mathrm{C}$
${ }^{1}$ H NMR (300 MHz, DMSO-d6): $\delta 11.99(\mathrm{~s}, 1 \mathrm{H}), 9.53(\mathrm{~s}, 1 \mathrm{H}), 8.49(\mathrm{~d}, J=9.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.39(\mathrm{~d}, J=$ $9.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.45(\mathrm{~s}, 2 \mathrm{H}), 2.22(\mathrm{t}, J=7.25 \mathrm{~Hz}, 2 \mathrm{H}), 1.75-1.62(\mathrm{~m}, 2 \mathrm{H}), 1.60-1.50(\mathrm{~m}, 2 \mathrm{H}), 1.42-$ $1.32(\mathrm{~m}, 2 \mathrm{H})$.

[^0]IR: 2903 (w), 1698 (m), 1584 (s), 1495 (m), 1333 (m), 1298 (vs), 1168 (m), 1118 (m), 995 (m) 905 (w), 835 (m), 738 (w).

## 7. $\boldsymbol{N - ( 2 - ( ( 2 - ( ( 7 - c h l o r o q u i n o l i n - 4 - y l ) a m i n o ) e t h y l ) ( i s o p r o p y l ) a m i n o ) e t h y l ) - 6 - ( ( 7 - n i t r o b e n z o - ~}$ [c][1,2,5]oxadiazol-4-yl)amino)hexanamide (6)

To a solution of molecule (4) ( $100 \mathrm{mg}, 0.246 \mathrm{mmol}, 1$ eq.) in ether ( 5 mL ) was added $\mathrm{HCl}(6 \mathrm{M}, 2$ mL ). The mixture was stirred for 30 min . A 1 N NaOH solution was added until a white precipitate appears. The mixture was extracted with DCM $(2 \times 10 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. The residue (5) was dissolved in DCM ( 5 ml ) then EDC ( $0.067 \mathrm{~mL}, 0.37 \mathrm{mmol}, 1.5 \mathrm{eq}$.$) , \mathrm{HBTU}(93.2 \mathrm{mg}, 0.25 \mathrm{mmol}, 1 \mathrm{eq}$. ) and compound (7) ( $72.3 \mathrm{mg}, 0.25 \mathrm{mmol}, 1 \mathrm{eq}$. ) were added. The mixture was stirred for 4 hours. Water ( 5 mL ) and 5 mL of 1 N NaOH solution were added. The mixture was extracted with DCM ( $3 \times 10 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. The crude was purified with automatic silica gel column chromatography (eluent: $\mathrm{CHCl}_{3} / \mathrm{MeOH}$, gradient: ( $100 / 0$-> $90 / 10$ ). The product ( 6 ) was obtained as an orange solid ( 90 mg ). Yield $63 \%$.

## IV. Physico-chemistry (materials and methods)

1- Solvents and Material. Chloroquine (Sigma, diphosphate salt) was purchased from commercial source and used without further purification. The CQ analogues (compound 2, compound 4, Fluo-CQ and 7) were synthesized according to the procedures described above. All analyses were carried out with distilled water, spectroscopic grade dimethylsulfoxide DMSO, Bioreagent for molecular biology, >> 99.9\%, Sigma), acetonitrile (E. Merck Uvasol, for spectroscopy) or with spectroscopic grade dichloromethane (Merck, $99.8 \%$ for spectroscopy). Distilled water was further purified by passing it through a mixed bed of ionexchanger (Bioblock Scientific R3-83002, M3-83006) and activated carbon (Bioblock Scientific ORC83005 ) and was de-oxygenated by $\mathrm{CO}_{2}-$ and $\mathrm{O}_{2}$-free argon (Sigma Oxiclear cartridge) before use. The ionic strength was maintained at 0.1 M with sodium perchlorate $\left(\mathrm{NaClO}_{4} \cdot \mathrm{H}_{2} \mathrm{O}\right.$, Merck, p.a.) whatever the solvent used (water or water/DMSO). Hematin ( $\mathrm{Fe}{ }^{\text {III }} \mathrm{PPIX}(\mathrm{OH})$ ) solution was prepared from hemin equine Type III ( $\mathrm{Fe}^{\text {III }}$ PPIXCl, Sigma-Aldrich) and $50 \%$ aqueous ammonia (ESI-MS CID experiments) vigorously stirred at room temperature (RT) for 1 h . Stock solutions of the substrates for ESI-MS CID experiments for the different assays were freshly prepared in Eppendorf tubes just before the experiments. All solutions were protected from daylight to avoid any photochemical degradation. All the stock solutions were prepared by weighing solid products using a Mettler Toledo XA105 Dual Range ( $0.01 / 0.1 \mathrm{mg}-41 / 120 \mathrm{~g}$ ) and the complete dissolution was achieved using an ultrasonic bath. The concentrations of the stock solutions of the compounds $\left(\approx 10^{-4} \mathrm{M}\right)$ were calculated by quantitative dissolution of solid samples in the corresponding solutions. All the physico-chemical measurements were carried out at $25.0(2)^{\circ} \mathrm{C}$.
2- Potentiometry. The potentiometric measurements were performed using an automatic titrator system 794 Basic Titrino (Metrohm) with a combined glass electrode (Metrohm 6.0234.500, Long Life) filled with 0.1 M NaCl in water and connected to a microcomputer (Tiamo light 1.2 program for the acquisition of the potentiometric data). The combined glass electrode was calibrated as a hydrogen concentration probe by titrating known amounts of perchloric acid ( $\sim 10^{-2} \mathrm{M}$ from $\mathrm{HClO}_{4}$, Prolabo, normapur, $70 \% \mathrm{~min}$ ) with $\mathrm{CO}_{2^{-}}$ free sodium hydroxide solution ( $\sim 10^{-1} \mathrm{M}$ from $\mathrm{NaOH}, \mathrm{BdH}$, AnalaR). ${ }^{3}$ The $\mathrm{HClO}_{4}$ and NaOH solutions were freshly prepared just before use and titrated with sodium tetraborate decahydrate $\left(\mathrm{B}_{4} \mathrm{Na}_{2} \mathrm{O}_{7} \cdot 10 \mathrm{H}_{2} \mathrm{O}\right.$, Fluka, puriss, p.a.) and potassium hydrogen phthalate ( $\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{KO}_{3}$, Fluka, puriss, p.a.), respectively, using methyl orange (RAL) and phenolphthalein (Prolabo, purum) as the indicators. The cell was thermostated at $25.0 \pm 0.2^{\circ} \mathrm{C}$ by the flow of a Lauda E200 thermostat. A stream of argon, pre-saturated with water vapor, was passed over the surface of the solution. The Glee program3 was applied for the glass electrode calibration (standard electrode potential $\mathrm{E}_{0} / \mathrm{mV}$ and slope of the electrode $/ \mathrm{mV} \mathrm{pH}^{-1}$ ) and to check carbonate levels of the NaOH solutions used (<5\%).
3- Absorption Spectrophotometric Titrations versus pH. Absorption spectrophotometric titrations as a function of pH of CQ and compound $\mathbf{2}$ were performed in water while those of Compound $\mathbf{4}$ and Fluo-CQ were performed in water/DMSO ( $1 / 1 \mathrm{v} / \mathrm{v}$ ) for solubility reasons. Stock solutions of CQ ( 1.01 mM ) and compound $2(0.986 \mathrm{mM})$ were prepared by quantitative dissolution of the corresponding solid samples in deionised water and the ionic strength was adjusted to 0.1 M with $\mathrm{NaClO}_{4}$ (Fluka, puriss). Stock solutions of compound $4(1.01 \mathrm{mM})$ and Fluo-CQ $(1.03 \mathrm{mM})$ were prepared by quantitative dissolution of the corresponding solid samples in pure DMSO. Prior to measurements, CQ and compound $\mathbf{2}$ were diluted with water containing 0.1 M of $\mathrm{NaClO}_{4}$, while compound $\mathbf{4}(1.01 \mathrm{mM})$ and Fluo-CQ were diluted with a mixed solvent containing $50 \%$ water with 0.2 M of $\mathrm{NaClO}_{4}$ and $50 \%$ of DMSO (by volume). 40 mL of the solutions were introduced into a jacketed cell (METROHM) maintained at $25.0 \pm 0.2^{\circ} \mathrm{C}$ (Lauda E200). The free hydrogen ion concentration was measured with a combined glass electrode (METROHM 6.0234.500, Long Life) and an automatic titrator system 794 Basic Titrino (Metrohm). The $\mathrm{Ag} / \mathrm{AgCl}$ reference glass electrode was filled with $\mathrm{NaCl}(0.1 \mathrm{M}$, Fluka, p.a.) and was calibrated as a hydrogen concentration probe as described above. The initial pH was adjusted to $\sim 2$ with $\mathrm{HClO}_{4}$ (Prolabo, normapur, $70 \% \mathrm{~min}$ ), and the
(3) Gans, P., and O'Sullivan, B. (2000) GLEE, a new computer program for glass electrode calibration Talanta 51, 33-37.
titrations of the free ligands were then carried out by addition of known volumes of NaOH solutions ( BdH , AnalaR) with an Eppendorf microburette. Special care was taken to ensure that complete equilibration was attained. Absorption spectra versus pH were recorded using a Varian CARY 50 spectrophotometer fitted with Hellma optical fibers (Hellma, 041.002-UV) and an immersion probe made of quartz suprazil (Hellma, $661.500-\mathrm{QX})$. The temperature was maintained at $25.0(2)^{\circ} \mathrm{C}$ with the help of a Lauda E200 thermostat.
4- Spectrofluorimetric Titrations versus $\mathbf{p H}$. Emission spectrophotometric titrations of the same set of ligands were thereafter carried out. The luminescence titrations were carried out on diluted solutions with an absorbance smaller than 0.1 at wavelengths $\geq \lambda_{\text {exc }}$ in order to avoid any errors due to the inner filter effect and to minimize re-absorption processes. The excitation wavelength corresponds to the smallest absorbance amplitudes measured along the absorption spectrophotometric titrations. 40 mL of solutions were introduced in a jacketed cell (METROHM) maintained at $25.0(2){ }^{\circ} \mathrm{C}$ (Lauda E200). The free hydrogen ion concentration was measured with a combined glass electrode (METROHM 6.0234.500, Long Life) and an automatic titrator system 716 DMS Titrino (Metrohm). The initial pH was adjusted to $\sim 2$ with $\mathrm{HClO}_{4}$ (Prolabo, normapur, $70 \% \mathrm{~min}$ ), and the titrations were then carried out by addition of known volumes of NaOH solutions (BdH, AnalaR) with an Eppendorf microburette. Special care was taken to ensure that complete equilibration was attained. The luminescence spectra were recorded on a Perkin-Elmer LS-50B maintained at $25.0(2){ }^{\circ} \mathrm{C}$ by the flow of a Haake FJ thermostat. The light source was a pulsed xenon flash lamp with a pulse width at half peak height $<10 \mu \mathrm{~s}$ and power equivalent to 20 kW . The slit width was set at 15 nm for both the excitation and the emission.
