General information

All reactions that required anhydrous conditions were carried by standard procedures under nitrogen atmosphere. Commercially available reagents from Alfa Aesar and Adams-beta were used as received. The solvents were dried by distillation over the appropriate drying reagents.

Melting points were measured on a Meltemp melting point apparatus and were not corrected. ¹H NMR spectra were recorded on commercial instruments (400 MHz). Chemical shifts were reported in ppm from tetramethylsilane with the solvent resonance as the internal standard (CDCl₃, δ = 7.26). Spectra were reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constants (Hz), integration and assignment. ¹³C NMR spectra were collected on commercial instruments (101 Hz) with complete proton decoupling. Chemical shifts are reported in ppm from the tetramethylsilane with the solvent resonance as internal standard (CDCl₃, δ = 77.0).

1. General procedural for the preparation of spiro bi-tetrahydroquinole 3

A reaction tube was charged with the 1,2-DHQ **1** (0.2 mmol, 1 eq.), imine **2** (0.2 mmol, 1 eq.), anhydrous toluene (2 mL), InCl₃ (0.01 mmol, 0.05eq). The system was stirred under a nitrogen atmosphere at 40 °C for 18 h. Then the products were obtained by purification with flash silica gel chromatography eluted with petroleum: ethyl acetate (5:1).

2. General procedural for the preparation of functionalized 1,2-DHQ 4

A reaction tube was charged with the 1,2-DHQ **1** (0.2 mmol, 1 eq.), imine **2** (0.2 mmol, 1 eq.), anhydrous toluene (2 mL), TsOH (0.02 mmol, 0.1eq). The system was stirred under a nitrogen atmosphere at 40 °C for 24 h. Then the products were obtained by purification with flash silica gel chromatography eluted with petroleum: ethyl acetate (10:1).

3. NMR experiment for exploring the reaction process

0.1 mmol dihydroquinoline **1a**, 0.1 mmol TsOH were dissolved in 0.5 mL DMSO-*d*₆. After analyzed with NMR, a drop of D₂O was added and the mixture was analyzed again with NMR. The NMR Results were depicted in Figure S1.

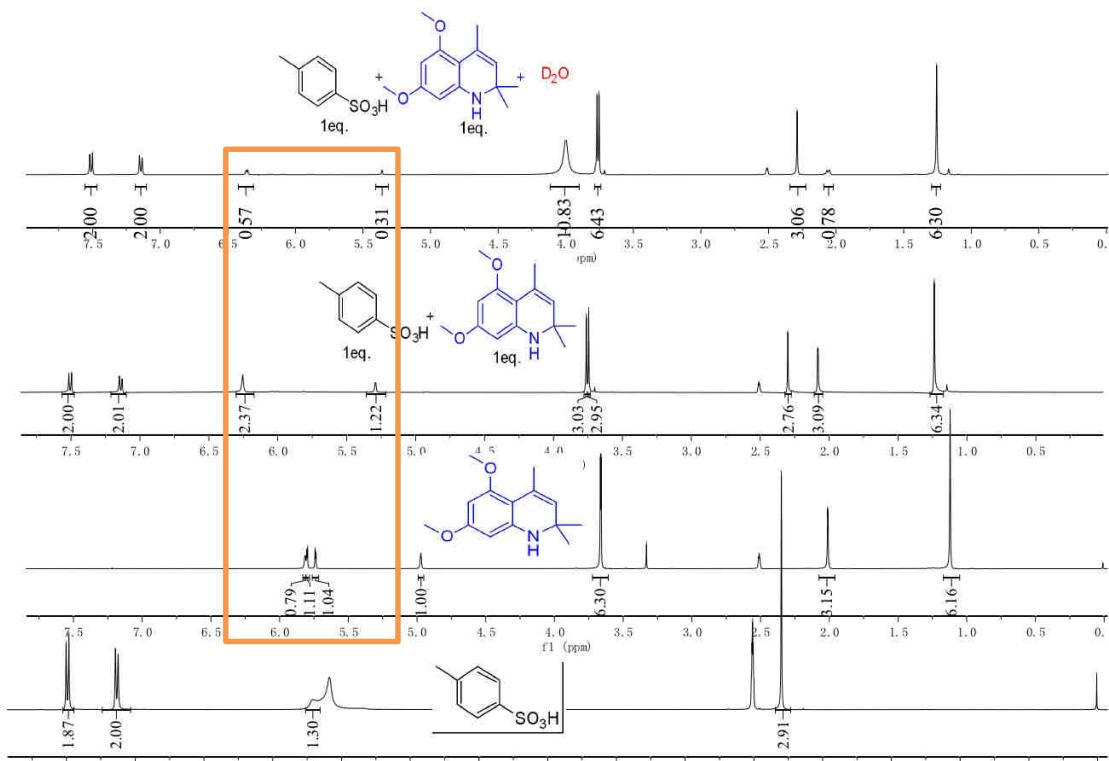

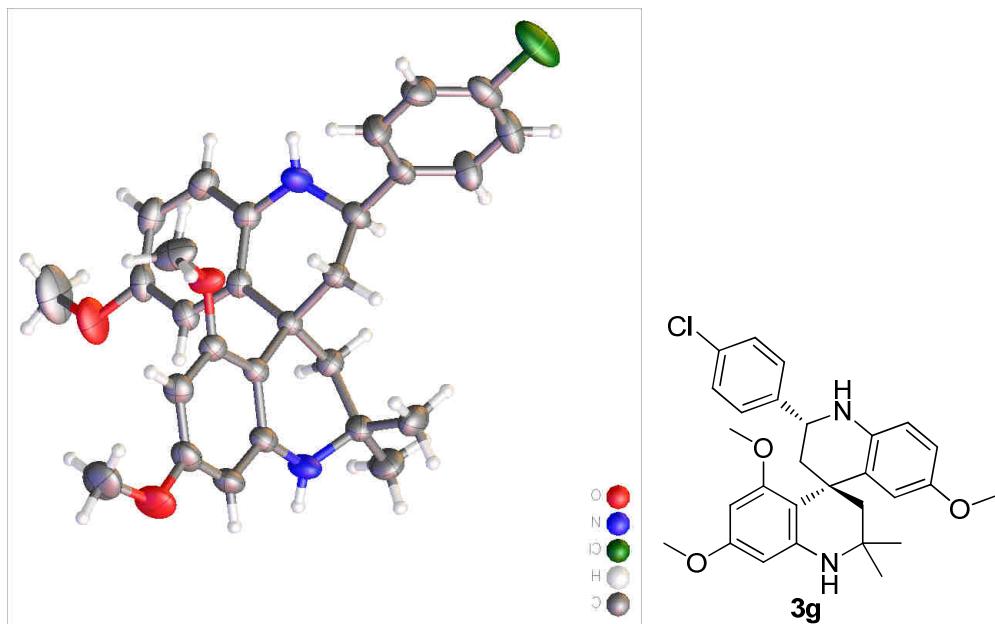

Figure s1 NMR results for the exploration of the reaction process.

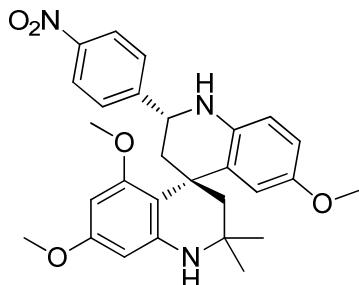

The results revealed that the signal of the aromatic hydrogen and the alkene hydrogen of **1j** moved to the lower field after the addition of equal equivalent of TsOH. This indicated that the electro density of the phenyl ring was decreased, which might be ascribed to the electrophilic substitution of the phenyl ring. Then the D₂O exchange experiment revealed that both the phenyl hydrogen and the alkene hydrogen, even the 4-CH₃ hydrogen were deuterated. These explained that the reactions could easily occur at phenyl ring, the alkene as well as the 4-CH₃.
