## 4. Evaluation of synthesis phenanthridine 3 from 2-isocyanobiphenyl and $\mathrm{C}_{4} \mathrm{~F}_{9}$-I via a radical cascade process

All screening reactions were carried out at a 0.2 mmol scale in a 4 mL glass vial (Thermo Scientific, National B7999-2) sealed with PTEF cap and stirred on bench top. 2-Isocyanobiphenyl 1, $\mathrm{C}_{4} \mathrm{~F}_{9} \mathrm{I}$ and other specified reagents were dispersed in 2 mL of solvent and the resulting mixture was purged with Ar (if necessary) and vigorously stirred at specified temperature under light irradiation (laid 10 CM away from the vial, if necessary) for 20 hour. The solvent of the reaction mixture was removed under reduced pressure. The resulting residue was dissolved in 1 mL of $\mathrm{CDCl}_{3}$ along with $\mathrm{Cl}_{2} \mathrm{CHCHCl}_{2}(20 \mu \mathrm{~L})$ as an external standard for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis. The composition of reaction mixture was based on the $\mathrm{Ar}-\mathrm{H}$ at $8.73 \mathrm{ppm}(\mathrm{d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H})$ for compound 3 .

Scheme S19

In a 40 mL borosilicate glass vial, 2-isocyanobiphenyl $\mathbf{1}(179 \mathrm{mg}, 1.0 \mathrm{mmol}, 1.0$ equiv), perfluorobutyl iodide $2\left(1.04 \mathrm{~g}, 3.0 \mathrm{mmol}, 3.0\right.$ equiv) and $N, N, N^{\prime}, N^{\prime}-$ tetraethylenediamine (TEEDA) ( $258 \mathrm{mg}, 1.5 \mathrm{mmol}, 1.5$ equiv) were dispersed in 10 mL of THF. The reaction vial was then purged with Ar for 1 min and sealed with PTEF cap. The reaction mixture was vigorously stirred at $30^{\circ} \mathrm{C}$ under irradiation of CFLlamp (25W, laid 10 CM away from the vial) and monitored by TLC analysis. After 36 hour, all the 2-Isocyanobiphenyl 1 was consumed. Then the mixture was concentrated in vacuo, and the residue was purified by silica gel flash chromatography to give compound $\mathbf{3}$ in $89 \%$ yield ( 353 mg ).

The total volume of the mixture was 0.5 mL , and the total amount of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ and halogen bond acceptor was kept constant at $0.25 \mathrm{mmol}(0.5 \mathrm{M})$, while the amount of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ was varied from 0 to $0.25 \mathrm{mmol}(0-0.5 \mathrm{M})$. The stoichiometry was determined by plotting ratios of $\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}\right] \times \Delta \delta$ against ratios of $\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}\right] /\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}+\mathrm{XB}\right.$ acceptor $]$ to afford a maximum at
ratio $\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}\right] /\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}+\mathrm{XB}\right.$ acceptor $]=0.5$, which meant a 1:1 complex ratio between $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ and XB acceptor.

## 11. Determination of the association constant $\left(K_{a}\right)$

The association constant ( $K_{a}$ ) was calculated using Hanna and Ashbaugh's ${ }^{12-15}$ Graphical method: For ideal behaviour in an interaction between an halogen bond donor molecule $\mathbf{C}_{10} \mathbf{F}_{\mathbf{2}} \mathbf{I}$ and an lewis base molecule $\mathbf{L B}$ to form a halogen bond complex $\mathbf{X B}$, we may define an association constant $\boldsymbol{K}$, where

$$
\begin{equation*}
K=[\mathrm{XB}] /[\mathrm{LB}]\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}\right] \tag{1}
\end{equation*}
$$

For 1:1 molecular complexes, when the concentration of lewis base molecule is in large excess we have

$$
\begin{equation*}
\delta_{\text {obs }-} \delta_{0}=\frac{[\mathrm{XB}]}{[\mathrm{XB}]+\left[\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}\right]}\left(\delta_{\mathrm{XB}}-\delta_{0}\right) \tag{2}
\end{equation*}
$$

where $\delta_{\text {obs }}$ is the observed fluorine chemical shift of the $-\mathrm{CF}_{2} \mathrm{I}$ group in the complexing medium, $\delta_{0}$ is the fluorine chemical shift of the $-\mathrm{CF}_{2} \mathrm{I}$ group in the uncomplexed state and $\delta_{\mathrm{XB}}$ is the fluorine chemical shift of the $-\mathrm{CF}_{2} \mathrm{I}$ group in the pure complex. If $\Delta=\delta_{\text {obs }}$ $-\delta_{0}$ and $\Delta_{0}=\delta_{\mathrm{XB}}-\delta_{0}$, then substituting Eq. (1) into Eq. (2), we obtain Eq. (3) as follows:

$$
\begin{equation*}
\Delta=\frac{[\mathrm{LB}] K}{1+[\mathrm{LB}] K} \Delta_{0} \tag{3}
\end{equation*}
$$

This assumes that $\delta_{\text {obs }}$ is the result of molecular complexing between halogen bond donor molecule $\mathbf{C}_{\mathbf{1 0}} \mathbf{F}_{\mathbf{2}} \mathbf{I}$ and lewis base molecule $\mathbf{L B}$, and that there are no significant solvent effects on chemical shifts of the various species.

To obtain $K$ from a series of measurements of $\Delta$ for various values of [LB], the Eq. (3) may be rewritten as:

$$
\begin{equation*}
\frac{1}{\Delta}=\frac{1}{K \Delta_{0}} \frac{1}{[\mathrm{LB}]}+\frac{1}{\Delta_{0}} \tag{4}
\end{equation*}
$$

Plots of $1 / \Delta$ against $1 /[\mathrm{LB}]$ should be a straight line, $K$ may be obtained from the gradient using the value of $1 / \Delta_{0}$ from the intercept of the line with the ordinate:

$$
\begin{equation*}
K=\left(\frac{1}{\Delta_{0}}\right) /\left(\frac{1}{K \Delta_{0}}\right)=\text { intercept / gradient } \tag{5}
\end{equation*}
$$

The association constant of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ and TEEDA ( $K_{T h F}$ ) was calculated (average of three experiments) to be $0.28\left(K_{\text {ThF }}=0.28 M^{-1}\right)$.
11.4 Determination of the association constant of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ and dioxane ( $K_{\text {Dioxane }}$ )
${ }^{19} \mathrm{~F}$ NMR spectra of ten samples of mixtures of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ and dioxane in $\mathrm{CDCl}_{3}$ were recorded at 298 K (Fluorobenzene ( $\delta_{\text {F-Ph }}=-113.066$ ) was used as internal standard). The total volume of the mixture was 0.6 mL , the amount of $\mathrm{C}_{10} \mathrm{~F}_{21} \mathrm{I}$ was kept constant at $0.03 \mathrm{mmol}(19.4 \mathrm{mg})$, while that of dioxane was varied from 0.03 to $0.05 \mathrm{mmol} .{ }^{19} \mathrm{~F}$ NMR for each sample was recorded and the chemical shifts differences ( $\Delta \delta$ ) for - $\mathrm{CF}_{2} \mathrm{I}$ were used to draw the plot.

## 12. Evaluation of different light source

2-Isocyanobiphenyl 1 ( $35.8 \mathrm{mg}, 0.2 \mathrm{~mol}, 1.0$ equiv), $\mathrm{C}_{4} \mathrm{~F} 9 \mathrm{I}$ ( $207.5 \mathrm{mg}, 0.6 \mathrm{~mol}, 3.0$ equiv) and TEEDA ( $0.3 \mathrm{~mol}, 1.5$ equiv) were dispersed in 2 mL of THF. The reaction
vial was then purged with Ar for 1 min , sealed with PTEF cap. The reaction mixture was vigorously stirred at $30^{\circ} \mathrm{C}$ under the irradiation of differnet light source (25W, laid 10 CM away from the vial) for 36 h . Then THF was removed under reduced pressure. The resulting residue was dissolved in 1 mL of $\mathrm{CDCl}_{3}$ along with $\mathrm{Cl}_{2} \mathrm{CHCHCl}_{2}(20 \mu \mathrm{~L})$ as an external standard for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis. The composition of reaction mixture was based on the Ar-H at $8.73 \mathrm{ppm}(\mathrm{d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H})$ for compound 3 .

## Scheme S23

As shown in Scheme S23, the source of light clearly has an impact to the reaction of $\mathbf{1}$ and $\mathbf{2}$ for synthesis of $\mathbf{3}$. Irradiation by LED lamp of red, yellow and green colors (25W) gave little product $\mathbf{3}$; the blue LED lamp with relatively shorter emission wavelength (25W) gave $21 \%$ yield, the purple LED lamp with relatively shorter emission wavelength ( 25 W ) gave $57 \%$ yield. The irradiation of UV lamp ( 254 or 360 nm ), CFL of the same power intensity or sunlight gave excellent yields. It is known that CFLemit small amount of UV light. These results suggest that the low-intensity irradiation in the UV region is responsible for the XB-promoted photochemical activation of Rf-I.
