## 1. Synthesis of copolymers of PDTBDT-BT and PDTBDT-FBT

Scheme S1. Synthesis routes of the PDTBDT-BT and PDTBDT-FBT

### 1.1. Synthesis of PDTBDT-BT

2,7-Di(trimethylstannyl)-5,10-bis(4,5-didecylthien-2-yl)dithieno[2,3-d:2', 3'- $d$ ] benzo[1,2-b: 4,5$\mathrm{b}^{\prime}$ ]dithiophene ( $0.20 \mathrm{mmol}, 270.9 \mathrm{mg}$ ) and 4,7-dibromobenzothiadiazole ( $0.20 \mathrm{mmol}, 58.4 \mathrm{mg}$ ) were dissolved into the mixture solution 6 mL of toluene and 0.7 mL of DMF in a monomicrowave reaction tube. After being purged with argon for 20 min, tris(dibenzylideneacetone)dipalladium (0) ( $\left.\mathrm{Pd}_{2}(\mathrm{dba})_{3}\right) \quad\left(\begin{array}{ll}2.0 & \mathrm{mg})\end{array}\right.$ and tris(3-methoxyphenyl)phosphine ( 4.0 mg ) was added. Then the tube was transferred into a glove box with moisture and oxygen under 1 ppm , and the mixture was purged with argon for another 10 min . The screwed-up tube was subjected to the following reaction conditions in a microwave reactor: $120^{\circ} \mathrm{C}$ for $5 \mathrm{~min}, 140^{\circ} \mathrm{C}$ for 5 min and $160{ }^{\circ} \mathrm{C}$ for 20 min . At the end of polymerization, the polymers were end-capped with 2-(tributylstannyl)thiophene and 2-bromothiophene to remove bromo and trimethylstannyl end groups. The mixture was then poured into methanol. The precipitated material was collected and extracted with ethanol, acetone, hexane and toluene in a Soxhlet extractor. The solution of the copolymer in toluene was condensed to 20 mL and then
poured into methanol ( 500 mL ). The precipitation was collected and dried under vacuum overnight (yield: $71 \%$ ). $M_{\mathrm{n}}=46,830 \mathrm{~g} / \mathrm{mol}$ with a polydispersity index (PDI) of 2.36.

### 1.2. Synthesis of PDTBDT-FBT

The PDTBDT-FBT was synthesized as the procedure of PDTBDT-BT, except that the polymerization was carried out with 2,7-di(trimethylstannyl)-5,10-bis(4,5-didecylthien-2-yl)dithieno[2,3- $\left.d: 2^{\prime}, 3^{\prime}-d\right]$ benzo[1,2- $\left.b: 4,5-b^{\prime}\right]$ dithiophene ( $0.20 \mathrm{mmol}, 270.9 \mathrm{mg}$ ) and 4,7-dibromo-5,6-difluorobenzothiadiazole ( $0.2 \mathrm{mmol}, 65.6 \mathrm{mg}$ ). Yield: $68 \% . M_{\mathrm{n}}=53,320 \mathrm{~g} / \mathrm{mol}$ with PDI of 2.13.
