(I) X-ray crystallographic structures of <b>4a</b> and <b>6b</b> .....	S40
(J) References.....	S42
(K) NMR spectra.....	S43

### (A) General Information:

All the starting materials were obtained from commercial sources and used without further purification unless otherwise stated.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded on a Agilent 400MR (400 MHz) spectrometer. Chemical shifts were reported in parts per million (ppm), and the residual solvent peak was used as an internal reference: proton (chloroform  $\delta$  7.26), carbon (chloroform  $\delta$  77.1). Multiplicity was indicated as follows: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), dd (doublet of doublet), br s (broad singlet). Coupling constants were reported in Hertz (Hz). All high resolution mass spectra were obtained on a Finnigan/MAT 95XL-T spectrometer. For thin layer chromatography (TLC), Merck pre-coated TLC plates (Merck 60 F254) were used, and compounds were visualized with a UV light at 254 nm. Further visualization was achieved by staining with iodine, or ceric ammonium molybdate followed by heating on a hot plate. Flash chromatographic separations were performed on Merck 60 (0.040- 0.063 mm) mesh silica gel. Optical rotations were reported as follows:  $[\alpha]_D^T$  ( $c$ : g/100 mL, in solvent). The enantiomeric excesses of products were determined by chiral-phase HPLC analysis, using a Daicel Chiralcel AD-H column (250 x 4.6 mm).

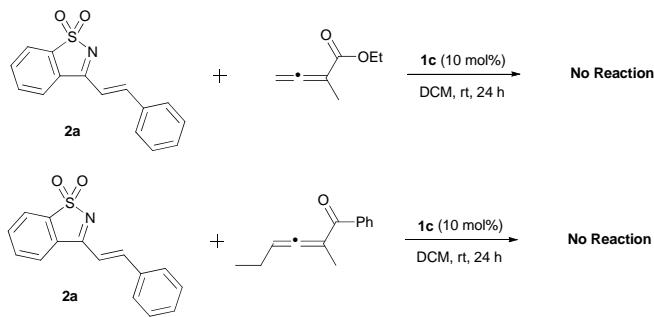

The 1-azadienes were prepared according to reported procedure.<sup>[1]</sup> The allenones were prepared according to reported procedure.<sup>[2]</sup> The phosphine catalysts were prepared by our previously reported procedures.<sup>[3]</sup>

### (B) Proposed transition state for phosphine-catalyzed [4+2]-annulation

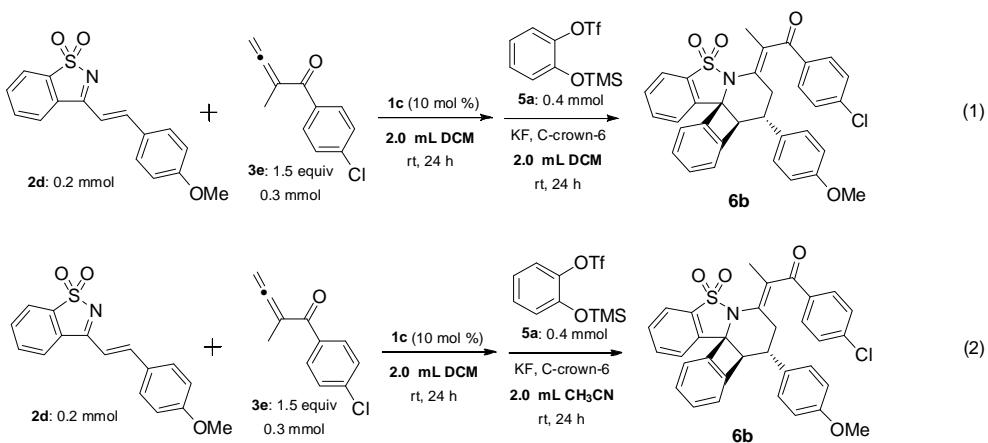

The intermolecular hydrogen bond was proposed to be formed between amide moiety of chiral phosphine and 1-azadiene substrate. The phosphonium dienolate intermediate, generated from the nucleophilic attack of the phosphine catalyst at the allenone (**TS-1**), attacked the *Re*-face of 1-azadiene to afford the [4+2]-annulation adduct **4a** with (*S*)-configuration. On the other hand, intramolecular aza 1,4-addition of **TS2** formed the **TS3**. The interaction between phosphonium and enolate may be crucial for formation of the *E*-isomer of the product **4a**.

**(C) Other substrate participating reaction**

When alpha-methyl-allenoates and gamma-substituted allenones were used, no reaction took place under standard reaction conditions.

**(D) One-pot [4+2]/[2+2] reaction**

One-pot [4+2]/[2+2] reaction without purification: the reaction got only 10% yield of **6b** and 60% yield of [4+2]-cycloaddition product in DCM (eq 1). The yield of **6b** could be improved to 40%, when [2+2]-cycloaddition took place in CH<sub>3</sub>CN (eq 2; removed the DCM after the [4+2]-cycloaddition).

**(E) Representative procedure for [4+2] cycloaddition of allene ketones with 1-azadienes:**

A dry reaction tube was charged with the phosphine **1c** (0.02 mmol), 1-azadiene (**2a**) (0.2 mmol), allene ketones (**3a**) (0.3 mmol). Then, DCM (2.0 mL) was added and the mixture was stirred at room temperature for 24 h. Separation by column chromatography on silica gel with hexane/ethyl acetate (10:1-6:1) afforded the desired [4+2] product **4a** in 61% yield and 99% *ee* with (*S*)-configuration.

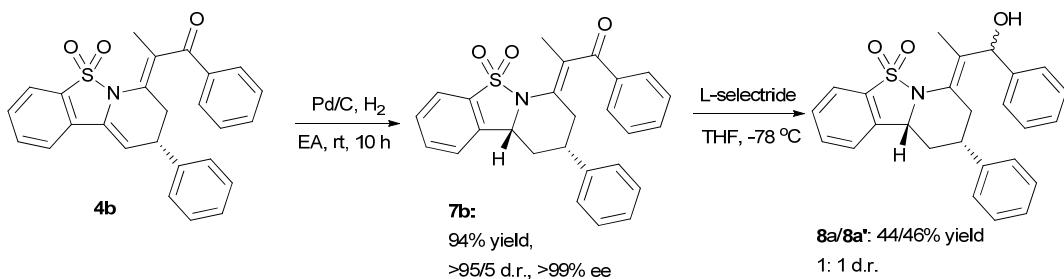

**Scale-up synthesis of 4n:**

A dry reaction round-bottom flask was charged with the phosphine **1c** (0.35 mmol), 1-azadiene (**2a**) (3.50 mmol), allene ketones (**3e**) (5.20 mmol). Then, DCM (20.0 mL) was added and the mixture was stirred at room temperature for 48 h. Subsequently, the solvent was removed under vacuum and the crude residue was purified by column chromatography on silica gel with hexane/ethyl acetate (10:1-6:1) afforded the desired [4+2] product **4n** in 81% yield (1.30 g) and 98% *ee*.

**(F) Representative procedure for [2+2] cycloaddition:**

A dry reaction tube was charged with [4+2] product **4a** (0.1 mmol), 18-crown-6 (0.3 mmol), KF (0.3 mmol) and CH<sub>3</sub>CN (1.0 mL). Then, 2-(trimethylsilyl)aryl triflate **5** (0.2 mmol) was added and the mixture was stirred at room temperature for 24 h. The reaction was quenched by H<sub>2</sub>O (10.0 mL) and extracted with EA (10 mL \* 3). The organic layer was dried with Na<sub>2</sub>SO<sub>4</sub>, and removed under vacuum. Subsequently, the crude residue was purified by flash column chromatography to afford the polycyclic piperidine **6a** in 58% yield and > 99% ee.

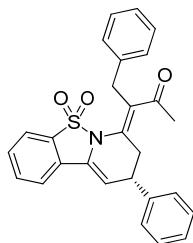

**(G) Synthetic applications of **4b**:**

a) To a stirred solution of **4b** (0.3 mmol) in anhydrous EA (15.0 mL) was added Pd/C (10 mol %). The reaction mixture was stirred overnight at room temperature under the H<sub>2</sub> atmosphere. After that, filtered the reaction mixture, and washed the solid with ethyl acetate (10.0 mL). Then, the filtrate was concentrated and the residue was purified directly by flash column chromatography (hexane/ethyl acetate = 10: 1- 6: 1) to get the product **7b** in 92% yield (81.4 mg), > 95: 5 d.r. and 99% ee.

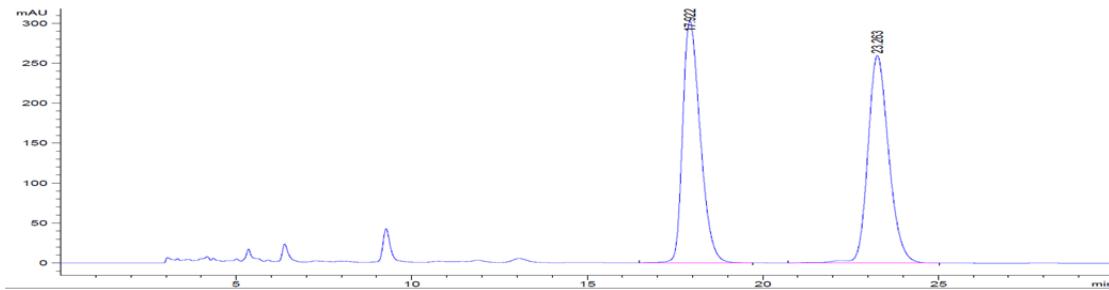

b) The stirred solution of **7b** (0.2 mmol) in anhydrous THF (10.0 mL) was cooled to -78 °C under the N<sub>2</sub> atmosphere. Then, *L*-selectride (0.3 mmol) was added to the mixture slowly. After that, the resulting mixture was stirred for 2 h at -78 °C until the reaction was finished. The reaction was quenched at -78 °C by H<sub>2</sub>O (50.0 μL). The d.r. was determined to be 1:1 by NMR analysis of crude mixture after a short column chromatography. Finally, the diastereo-isomers **8a** (38.5 mg)/**8a'** (40.1 mg) were separated by column (petroleum ether: ethyl acetate = 12:1) in 44% and 46% yield, respectively.

**(H) The analytical data for the products:**

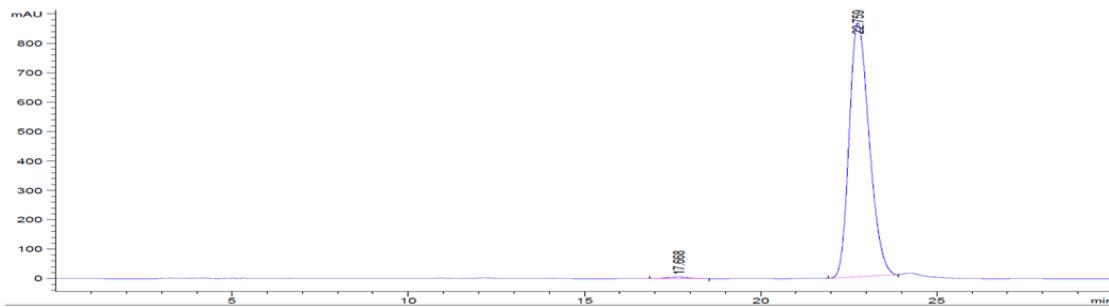

**(S,E)-3-(5,5-dioxido-9-phenyl-8,9-dihydro-7H-benzo[4,5]isothiazolo[2,3-a]pyridin-7-ylidene)-4-phenylbutan-2-one (4a)**

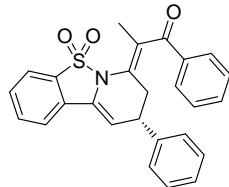

A white solid (53.3 mg), 61% yield, 99% *ee*.  $[\alpha]_D^{20} = -31.22$  (*c* = 0.41 in EtOAc). HPLC (chiral AD-H column), *n*-hexane/ *i*-PrOH = 75/25, flow rate 1.0 mL/min,  $\lambda$  = 254 nm,  $t_R$  (major) = 22.76 min,  $t_R$  (minor) = 17.67 min.  $^1\text{H}$  NMR (400 MHz, *cdcl*<sub>3</sub>)  $\delta$  7.79 (d, *J* = 7.8 Hz, 1H), 7.68 (ddd, *J* = 10.2, 8.6, 4.2 Hz, 2H), 7.63 – 7.52 (m, 1H), 7.42 – 7.10 (m, 10H), 5.99 (d, *J* = 5.2 Hz, 1H), 4.38 (d, *J* = 16.5 Hz, 1H), 4.02 – 3.82 (m, 2H), 2.94 – 2.71 (m, 2H), 1.61 (s, 3H).  $^{13}\text{C}$  NMR (100 MHz, *cdcl*<sub>3</sub>)  $\delta$  203.5, 142.0, 139.6, 137.7, 133.5, 132.2, 131.3, 130.9, 130.2, 128.9, 128.7, 128.5, 128.1, 127.3, 126.5, 121.3, 121.1, 106.9, 40.3, 37.0, 35.0, 30.0. ESI-HRMS: calcd for C<sub>27</sub>H<sub>23</sub>NNaO<sub>3</sub>S<sup>+</sup> ([M + Na]<sup>+</sup>) 464.1291, found 464.1269.
