## Evaluation of binding energy by the ONIOM procedure

The binding energy of $L$ with $M m-R$ is represented by eq. 1 in the ONIOM scheme;

$$
\begin{equation*}
\mathrm{BE}^{\mathrm{Mm}}=\mathrm{BE}_{\mathrm{Mm}-\mathrm{R}}^{\mathrm{Low}}+\mathrm{BE}_{\mathrm{SM} 1}^{\mathrm{High}}-\mathrm{BE}_{\mathrm{SM} 1}^{\mathrm{Low}} \tag{1}
\end{equation*}
$$

where the superscripts "Low" and "High" represent the low-level and high-level calculations, respectively. Similarly, the binding energy of L at the $\alpha$ site with Dm-R can be calculated by eq. 2 ;

$$
\begin{equation*}
\mathrm{BE}^{\alpha}=\mathrm{BE}_{\mathrm{D} m-\mathrm{R}}^{\alpha \mathrm{L} w}+\mathrm{BE}_{\mathrm{SM} 1}^{a \mathrm{High}}-\mathrm{BE}_{\mathrm{SM} 1}^{a \mathrm{Low}} \tag{2}
\end{equation*}
$$

In evaluating the binding energy $\mathrm{BE}^{\beta}$ at the $\beta$ site, we need to consider two small models SM1 and SM2 at the high level (eq. 3), because the L interacts with the Cu center and two phenyl moieties of the neighbor paddle-wheel unit;

$$
\begin{equation*}
\mathrm{BE}^{\beta}=\mathrm{BE}_{\mathrm{Dm}-\mathrm{R}}^{\beta L o w}+\left(\mathrm{BE}_{\mathrm{SM1}}^{\beta \text { High }}-\mathrm{BE}_{\mathrm{SM} 1}^{\text {BLow }}\right)+\left(\mathrm{BE}_{\mathrm{SM} 2}^{\beta \text { High }}-\mathrm{BE}_{\mathrm{SM} 2}^{\text {BLow }}\right) \tag{3}
\end{equation*}
$$

The $\mathrm{BE}_{\mathrm{Mm}-\mathrm{R}}^{\mathrm{Low}}, \mathrm{BE}_{\mathrm{Dm}-\mathrm{R}}^{\alpha \mathrm{Low}}$, and $\mathrm{BE}_{\mathrm{Dm}-\mathrm{R}}^{\text {BLow }}$ are calculated with eqs. 4-6.

$$
\begin{align*}
& \mathrm{BE}_{\mathrm{Mm}-\mathrm{R}}^{\mathrm{Low}}=E_{\mathrm{Mm}-\mathrm{R}-2 \mathrm{~L}}^{\mathrm{Low}} / 2-E_{\mathrm{Mm}-\mathrm{R}}^{\mathrm{Low}} / 2-E_{\mathrm{L}}^{\mathrm{Low}}  \tag{4}\\
& \mathrm{BE}_{\mathrm{D} m-\mathrm{R}}^{\mathrm{LLow}}=E_{\mathrm{D} m-\mathrm{R}-4 \mathrm{~L}}^{\mathrm{Low}} / 2-E_{\mathrm{D}-\mathrm{R}-2 \mathrm{~L}^{\beta}}^{\mathrm{Low}} / 2-E_{\mathrm{L}}^{\mathrm{Low}}  \tag{5}\\
& \mathrm{BE}_{\mathrm{Dm}-\mathrm{R}}^{\mathrm{Low}}=E_{\mathrm{Dm}-\mathrm{R}-4 \mathrm{~L}}^{\mathrm{Low}} / 2-E_{\mathrm{Dm}-\mathrm{R}-2 \mathrm{~L}^{\mathrm{L}}}^{\mathrm{Lo}} \tag{6}
\end{align*} 2-E_{\mathrm{L}}^{\mathrm{Low}}
$$

where $E_{\mathrm{Mm}-\mathrm{R}-2 \mathrm{~L}}^{\mathrm{Low}}$ and $E_{\mathrm{Mm}-\mathrm{R}}^{\mathrm{Low}}$ are the total energies of monomer models with and without L, and $E_{\mathrm{L}}^{\mathrm{Low}}$ is the total energy of one gas molecule, $E_{\mathrm{D} m-\mathrm{R}-4 \mathrm{~L}}^{\mathrm{Low}}$ is total energy of dimer model with 4 gas molecules, and $E_{\mathrm{Dm}-\mathrm{R}-2 \mathrm{~L}^{\alpha}}^{\mathrm{Low}}$ and $E_{\mathrm{Dm}-\mathrm{R}-2 \mathrm{~L}^{\mathrm{B}}}^{\mathrm{Low}}$ are total energies of dimer model with 2 gas molecules at the $\alpha$ and $\beta$ positions, respectively.
The $\mathrm{BE}_{\mathrm{SM1}}^{\text {High }}, \mathrm{BE}_{\mathrm{SM1}}^{\alpha \text { High }}, \mathrm{BE}_{\mathrm{SM1}}^{\text {PHigh }}$ and $\mathrm{BE}_{\mathrm{SM} 2}^{\text {BHigh }}$ are calculated with eqs. 7-10.

$$
\begin{align*}
& \mathrm{BE}_{\mathrm{SM1}}^{\text {High }}=E_{\mathrm{SM1}-2 \mathrm{~L}}^{\text {High }} / 2-E_{\mathrm{SM1}}^{\text {High }} / 2-E_{\mathrm{L}}^{\text {High }}  \tag{7}\\
& \mathrm{BE}_{\mathrm{SM} 1}^{\text {High }}=E_{\mathrm{SM1} 1-2 \mathrm{~L}}^{\text {High }}-E_{\mathrm{SM1} 1-\mathrm{L}^{\mathrm{B}}}^{\text {High }}-E_{\mathrm{L}}^{\text {High }}  \tag{8}\\
& \mathrm{BE}_{\mathrm{SM} 1}^{\text {HHigh }}=E_{\mathrm{SM1} 1-2 \mathrm{~L}}^{\text {High }}-E_{\mathrm{SM1-L}^{a}}^{\text {High }}-E_{\mathrm{L}}^{\text {High }}  \tag{9}\\
& \mathrm{BE}_{\mathrm{SM} 2}^{\text {HHigh }}=E_{\mathrm{SM} 2 \mathrm{~L}}^{\text {High }}-E_{\mathrm{SM} 2}^{\text {High }}-E_{\mathrm{SM} 2}^{\text {High }} \tag{10}
\end{align*}
$$

where $E_{\mathrm{SM1-2L}}^{\text {High }}, E_{\mathrm{SM1} 1}^{\text {High }}, E_{\mathrm{SM2-L}}^{\text {High }}, E_{\mathrm{SM} 2}^{\text {High }}$ and $E_{\mathrm{L}}^{\text {High }}$ are total energies of SM1 with two L, SM1, SM2 with one L, SM2 and L, and $E_{\text {SM1-L }}^{\text {High }}$ and $E_{\text {SM1-1 }}^{\mathrm{High}}$ are total energies of SM1 with one gas
molecule at the $\alpha$ and $\beta$ positions, respectively. The $\mathrm{BE}_{\mathrm{SM1}}^{\mathrm{Low}}, \mathrm{BE}_{\mathrm{SM} 1}^{\alpha \mathrm{Low}}, \mathrm{BE}_{\mathrm{SM1}}^{\beta L \operatorname{low}}$ and $\mathrm{BE}_{\mathrm{SM} 2}^{\beta L o w}$ are calculated in similar ways to eqs. 7-10 at the low level.

Table S1. Geometrical parameters of monomer model Mm-R with adsorbed gas molecules.

${ }^{a}$ Average value of eight $\mathrm{Cu}-\mathrm{O}$ bonds in one Cu paddle-wheel unit.
${ }^{b} \mathrm{X}^{1}$ and $\mathrm{X}^{2}$ represent atoms in gas molecules; $\mathrm{CO}: \mathrm{X}^{1}=\mathrm{C}, \mathrm{X}^{2}=\mathrm{O} ; \mathrm{N}_{2}: \mathrm{X}^{1}=\mathrm{N}, \mathrm{X}^{2}=\mathrm{N} ; \mathrm{NO}:$
$\mathrm{X}^{1}=\mathrm{N}, \mathrm{X}^{2}=\mathrm{O} ; \mathrm{CO}_{2}: \mathrm{X}^{1}=\mathrm{O}, \mathrm{X}^{2}=\mathrm{C}$.
${ }^{c} \mathrm{O}^{\mathrm{C}}$ represents one O atom of carboxylate groups in a paddle-wheel unit.
${ }^{d}$ In parentheses are experimental results of CO -adsorbed Cu (aip)-PCP. ${ }^{1}$

## Discussion of the change in geometrical parameters by adsorption of gas molecule:

The $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}, \mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$, the averaged $\mathrm{Cu}-\mathrm{O}$ distances of $\mathrm{Dm}-\mathrm{H}-\mathrm{CO}$ agree with the experimental values, as shown in Table S 3 (column A); the averaged $\mathrm{Cu}-\mathrm{O}$ (carboxylate) distance is moderately longer than the experimental value but the difference is not large. However, the calculated $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance is somewhat longer than the experimental value in the case of $\mathrm{Dm}-\mathrm{Me}-\mathrm{CO}$, while the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ distance agrees with the experimental value. This longer $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance would arise from the steric repulsion of the methyl group with the carboxylate of the next $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{Me}\right)_{4}\right]$ unit (denoted B in Scheme $\mathrm{S} 1(\mathrm{~A})$ ); the steric repulsion enlarges the intermolecular distance between two $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{Me}\right)_{4}\right]$ units ( $\mathbf{A}$ and $\mathbf{B}$ ). In the real infinite system, however, such increase in the intermolecular distance would not occur, as shown in Scheme $\mathrm{S} 1(\mathrm{~B})$, because one more $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}\right.\right.$ $\left.\mathrm{Me})_{4}\right]$ unit (denoted $\mathbf{C}$ in Scheme $\mathrm{S} 1(\mathrm{~B})$ ) pushes back the central $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{Me}\right)_{4}\right]$ unit ( $\mathbf{A}$ in Scheme $\operatorname{S1}(B)$ ). These results suggest that the optimized $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}, \mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$, and the average $\mathrm{Cu}-\mathrm{O}$ distances agree with the experimental values in the cluster model, in which the steric repulsion is not large. We wish to focus on the geometry changes in Dm-H hereafter because the steric repulsion is small between the two dimer units.

It is interesting to investigate how the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}, \mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$, and the average $\mathrm{Cu}-\mathrm{O}$ distances change by the adsorption of gas molecule. When all $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ sites interact with gas molecule (Table S3 column A), the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ distance becomes longer, the $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ becomes shorter, and the averaged $\mathrm{Cu}-\mathrm{O}$ distance becomes moderately longer except for the NO adsorption system in which the geometrical changes are small, as shown in Table S3(A). The elongation of the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ distance occurs by the interaction of gas molecule because the gas molecule interacts with the Cu 4 p orbital to decrease the $4 \mathrm{p}-4 \mathrm{p}$ bonding interaction between the $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ atoms and also raises the $\mathrm{Cu} 3 \mathrm{~d}_{\mathrm{z2}}$ orbital energy to enhance the $\mathrm{d}_{\mathrm{z2}}-\mathrm{d}_{\mathrm{z2}}$ repulsion between the $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ atoms. As a result, the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ elongation occurs by the gas adsorption, which further decreases the $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance.

When gas molecule interacts only with the $\mathrm{Cu}^{\alpha}$ site (Table S 3 column B ), the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ distance increases to a lesser extent than that induced by interactions of four gas molecules with all $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ sites. However, the change in the $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance is not simple; it decreases to a less extent than that by interaction of four molecules with all Cu sites in the CO adsorption and it more decreases in the $\mathrm{N}_{2}, \mathrm{NO}$, and $\mathrm{CO}_{2}$ adsorption systems. When gas molecule interacts only with the $\mathrm{Cu}^{\beta}$ site (Table S3 column C), the $\mathrm{Cu}^{\alpha}-\mathrm{Cu}^{\beta}$ distance increases to a lesser extent than that induced by interaction of four molecules with all $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ sites. The $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance moderately increases unexpectedly because gas molecule between two $\mathrm{Cu}^{\beta}$ atoms induces the steric repulsion with another $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\right.\right.$ $\left.\mathrm{Me})_{4}\right]$ unit to increase the intermolecular distance between two $\left[\mathrm{Cu}_{2}\left(\mathrm{O}_{2} \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{Me}\right)_{4}\right]$ units.

It is likely concluded that the interaction of gas molecule with both $\mathrm{Cu}^{\alpha}$ and $\mathrm{Cu}^{\beta}$ atoms are important for discussing the geometry changes by gas interaction.
(A) Dimer Model

Me groups induce the steric repulsion between $\mathbf{A}$ and $\mathbf{B}$ units.

The anti-clockwise movement is induced.

The $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance increases.

(B) Real Cu (aip)-PCP

The anti-clockwise movement is suppressed by $\mathbf{C}$ unit.

The $\mathrm{Cu}^{\beta}-\mathrm{Cu}^{\beta}$ distance less increases.

Scheme S1. Schematic representation of (A) Dm-Me and (B) real Cu(aip)-PCP.

Table S4. NBO charges (e) for $\mathrm{Dm}-\mathrm{R}(\mathrm{R}=\mathrm{H}$, and Me$)$.

|  | $\mathrm{Dm}-\mathrm{H}$ |  |  |  | $\mathrm{Dm}-\mathrm{Me}$ |  |  |  |
