II. X-ray crystal structure determination of compound **2a**

Data collection and cell refinement of crystals were made by Stoe StadiVari diffractometer at 100 K using Dectris PILATUS3R 300K HPAD detector and microfocus source Xenocs Genix3D Cu HF with CuK α . The diffraction intensities were corrected for Lorentz and polarization factors. The structures were solved using programs SUPERFLIP³ or SHELXT⁴ and refined by the full-matrix least-squares procedure with SHELXL (version 2016/6).⁵ Geometrical analyses were performed with SHELXL. The structure was drawn with OLEX2 package.⁶

III. Quantum chemical calculation details

All structures were fully optimized with the DFT method at the M06-2X⁷ level with a 6-31G(d,p) basis set for all atoms. The nature of all extrema as minimum or transition state was characterized with analytical calculations of frequencies, and the transition states were connected to reactants and products with IRC calculations. Transition states were located using Synchronous Transit-Guided Quasi-Newton method (STQN)⁸ and fully optimized using Berny algorithm. The effect of solvent (dichloromethane) was taken in account using the PCM formalism during optimization and frequency calculations. All calculations were done with the Gaussian09 revision A.02 program packages. The non-covalent interaction analysis was performed using NCIPILOT version 3.0 with standard parameters.⁹
