Albuquerque, Nuria Martínez-Sáez, Jorge Castro-López, Fayna García-Martín, Ismael Compañón, Hiroshi Hinou, Shin-Ichiro Nishimura, Jesús Jiménez-Barbero, Juan L. Asensio, Alberto Avenoza, Jesús H. Busto, Ramón Hurtado-Guerrero, Jesús M. Peregrina, Gonçalo J. L. Bernardes, and Francisco Corzana

## Experimental

Reagents and general procedures. Commercial reagents were used without further purification. Analytical thin layer chromatography (TLC) was performed on Macherey-Nagel precoated aluminium sheets with a 0.20 mm thickness of silica gel 60 with fluorescent indicator UV254. TLC plates were visualized with UV light and by staining with phosphomolybdic acid (PMA) solution (5 g of PMA in 100 mL of absolute ethanol) or sulfuric acid-ethanol solution (1:20). Column chromatography was performed on silicagel (230-400 mesh). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were measured with a 400 MHz or a 300 MHz spectrometer, using the $\mathrm{H}_{2} \mathrm{O}$ residual as reference. Multiplicities are quoted as singlet (s), broad singlet (br s), doublet (d), doublet of doublets (dd), triplet (t), or multiplet (m). Spectra were assigned using COSY and HSQC experiments. All NMR chemical shifts ( $\delta$ ) were recorded in ppm and coupling constants ( $\mathcal{J}$ ) were reported in Hz . High resolution electrospray mass (ESI) spectra were recorded on a microTOF spectrometer; accurate mass measurements were achieved by using sodium formate as an external reference.

Solid-phase peptide synthesis (SPPS). All (glyco)peptides were synthesized by a stepwise micro-wave assisted solid-phase peptide synthesis on a Liberty Blue synthesizer using the Fmoc strategy on Rink Amide MBHA resin (0.1 mmol ). The glycosylated amino acid building block ( 2.0 equiv) was synthesized as described in the literature ${ }^{[51]}$ and manually coupled using HBTU [ $(2-(1 H-$ benzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate], while the other Fmoc amino acids ( 5.0 equiv) were automatically coupled using oxyma pure/DIC ( $N, N$-diisopropylcarbodiimide). The O-acetyl groups of (AcO) ${ }_{3} G a I N A c$ moiety were removed in a mixture of $\mathrm{NH}_{2} \mathrm{NH}_{2} / \mathrm{MeOH}$ (7:3). (Glyco)peptides were released from the resin, and all acid sensitive side-chain protecting groups were simultaneously removed using TFA 95\%, TIS (triisopropylsilane) 2.5\% and $\mathrm{H}_{2} \mathrm{O}$ $2.5 \%$, followed by precipitation with cold diethyl ether. The crude (glyco)peptides were purified by semi-preparative HPLC on a Phenomenex Luna C18(2) column $(10 \mu, 250 \mathrm{~mm} \times 21.2 \mathrm{~mm})$ and a dual absorbance detector, with a flow rate of 10 or $20 \mathrm{~mL} / \mathrm{min}$.

## Peptide fP

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{83} \mathrm{H}_{132} \mathrm{FN}_{27} \mathrm{O}_{28}:[\mathrm{M}+3 \mathrm{H}]^{3+}$ : 658.9979 found: 658.9991.

HPLC: $\mathrm{R}_{\mathrm{t}}=15.5 \mathrm{~min},($ Grad: acetonitrile/water+0.1\% TFA (10:90) $\rightarrow$ (20:80), $18 \mathrm{~min}, 10$ $\mathrm{mL} / \mathrm{min} \lambda=212 \mathrm{~nm})$.

## Glycopeptide fP*

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{91} \mathrm{H}_{145} \mathrm{FN}_{28} \mathrm{O}_{33}:[\mathrm{M}+3 \mathrm{H}]^{3+}: 726.6838$ found: 726.6871.

HPLC: $\mathrm{R}_{\mathrm{t}}=7.9 \mathrm{~min}$ (Grad: acetonitrile/water+0.1\% TFA (11:89) $\rightarrow$ (15:85), $9 \mathrm{~min}, 20$ $\mathrm{mL} / \mathrm{min}, \lambda=212 \mathrm{~nm}$ ).

## Peptide 2fP

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{83} \mathrm{H}_{131} \mathrm{~F}_{2} \mathrm{~N}_{27} \mathrm{O}_{28}:[\mathrm{M}+3 \mathrm{H}]^{3+}: 664.9948$ found: 664.9973.

HPLC: $\mathrm{R}_{\mathrm{t}}=6.6 \mathrm{~min}$ (Grad: acetonitrile/water+0.1\% TFA (13:87) $\rightarrow$ (19:81), $8 \mathrm{~min}, 20$ $\mathrm{mL} / \mathrm{min}, \lambda=212 \mathrm{~nm})$.

## Glycopeptide 2fP*

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{91} \mathrm{H}_{144} \mathrm{~F}_{2} \mathrm{~N}_{28} \mathrm{O}_{33}:[\mathrm{M}+3 \mathrm{H}]^{3+}: 732.6806$ found: 732.6880 .

HPLC: $\mathrm{R}_{\mathrm{t}}=7.9 \mathrm{~min}$ (Grad: acetonitrile/water+0.1\% TFA (12:88) $\rightarrow$ (17:83), $9 \mathrm{~min}, 20$ $\mathrm{mL} / \mathrm{min}, \lambda=212 \mathrm{~nm})$.

## Glycopeptide $\mathbf{P}^{*}$ '

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{57} \mathrm{H}_{95} \mathrm{~N}_{17} \mathrm{O}_{22}$ : $[\mathrm{M}+\mathrm{H}]: 1370.6838$ found: 1370.6885 .

HPLC: $R_{t}=15.60 \mathrm{~min}$ (Grad: acetonitrile/water+0.1\% TFA (5:95) $\rightarrow$ (15:85), $20 \mathrm{~min}, 20$ $\mathrm{mL} / \mathrm{min}, \lambda=212 \mathrm{~nm})$.

${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $\delta(\mathrm{ppm}):$ 0.95-0.97 (m, 6H, Val2 $\gamma$ ), 1.21-1.26 (m, 6H, Thr3 $\gamma$, Thr8 $\gamma$ ), 1.31-1.41 (m, 6H, Ala5 $\beta$, Ala11 $\beta$ ), 1.69-2.34 (m, 20H, Ac, Pro6 $\beta$, Pro10ß, Pro12 $\beta$, Pro6 $\gamma$, Pro10 $\gamma$, Pro12 $\gamma, \operatorname{Arg9\beta }$, Arg9 $\gamma, \mathrm{Val} 2 \beta$ ), 2.83-3.04 (m, 2H, Asp7 $\beta$ ), 3.173.27 (m, 2H, Gly1 $\alpha$ ).

${ }^{13} \mathrm{C}$ NMR 75 MHz in $\mathrm{D}_{2} \mathrm{O}$ registered at 298 K

## Glycopeptide fP*’

HRMS (ESI+) m/z: calcd. for $\mathrm{C}_{57} \mathrm{H}_{94} \mathrm{FN}_{17} \mathrm{O}_{22}:[\mathrm{M}+2 \mathrm{H}]^{2+}: 694.8444$ found: 694.8455 .

HPLC: $R_{t}=15.25 \mathrm{~min}$ (Grad: acetonitrile/water+0.1\% TFA (5:95) $\rightarrow$ (15:85), $20 \mathrm{~min}, 20$ $\mathrm{mL} / \mathrm{min}, \lambda=212 \mathrm{~nm})$.

${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $\delta(\mathrm{ppm}):$ : 0.95-0.97 (m, 6H, Val2 $\gamma$ ), 1.21-1.25 (m, 6H, Thr3 $\gamma$, Thr8 $\gamma$ ), 1.31-1.43 (m, 6H, Ala5 $\beta$, Ala11 $\beta$ ), 1.69-2.69 (m, 18H, Ac, Pro6 $\beta$, Pro10 Pro12 $\beta$, Pro10 $\gamma, \operatorname{Pro12\gamma }$, $\operatorname{Arg} 9 \beta$, $\operatorname{Arg} 9 \gamma, \operatorname{Val2} \beta$ ), 2.84-3.07 (m, 2H, Asp7ß), 3.17-3.27 (m, 2H, Gly1 $\alpha$ ), 5.33-5.52 (m, 1H, Pro6 $\gamma$ ).

A second set of signals (in a small percentage) is observed. They correspond to the cis disposition of the amide bond of proline residues (Dziadek, S.; Griesinger, C.; Kunz, H.; Reinscheid, U. M. Chem. Eur. J. 2006, 12, 4981-4993).

## Decoupled ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(282 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right)$

A second set of signals (in a small percentage) is observed. They correspond to the cis disposition of the amide bond of proline residues (Dziadek, S.; Griesinger, C.; Kunz, H.; Reinscheid, U. M. Chem. Eur. J. 2006, 12, 4981-4993).

Figure S1. Bio-layer interferometry (BLI) curves obtained for the studied (glyco)peptides and antibody SM3.

Figure S2. Bio-layer interferometry (BLI) fit obtained for the studied (glyco)peptides and antibody SM3, together with the $K_{D}$ constants.

Microarrays. Microarrays slides called "Antibody chip" were obtained from Sumitomo Bakelite Co., Ltd. (Tokyo, Japan). The size of a slide is $75-\mathrm{mm}$ long, $25-\mathrm{mm}$ wide and 1 -mm thick. Hybridization covers ( $60 \times 25 \times 0.7 \mathrm{~mm}$ ) were also obtained from Sumitomo Bakelite Co., Ltd. Anti-MUC1 mouse mAbs clon SM3 ( $0.2 \mathrm{mg} / \mathrm{mL}$ ) was purchased from Santa Cruz Biotechnology (TX, USA) and VU3C6 ( $0.86 \mathrm{mg} / \mathrm{mL}$ ) from Exalpha (MA, USA). FluoroLinkTM CyTM3-labeled goat anti-mouse IgG was from Amersham Biosciences (Buckinghamshire, UK).
Microarray printing. We selected plastic "Antibody chip" (Sumitomo Bakelite, Japan) due to the non-fouling surface and selective covalent immobilization to the $N$-terminal amino group of the MUC1 (glyco)peptides library.

The printing/immobilization of the (glyco)peptides was done following the instructions and using the buffers of the microarray slides kit. (Glyco)peptides were spotted by MicroSys 5100 (Cartesian Technologies, CA, USA) with a $0.6-\mathrm{mm}$ pitch using a Filgen solid spin ( $200 \mu \mathrm{~m}$ pin diameter). Each compound was printed in quadruplicate with 0.3 mm distance between spots of same compound and 0.6 mm gap among different
compounds (Figure S3, left panel). Each (glyco)peptide was printed at six different concentrations from $500 \mu \mathrm{M}$ to $15.6 \mu \mathrm{M}$ (Figure S3, right panel). Cy3 labeled BSA protein ( $25 \mu \mathrm{~g} / \mathrm{mL}$ ) was used as grid. Spotting conditions were $23{ }^{\circ} \mathrm{C}$ and $60 \%$ of humidity. After printing, slides were incubated for overnight on dry conditions. Next, non-reacted groups were inactivated by blocking buffer at $37^{\circ} \mathrm{C}$ for 1 h under slow agitation. Finally, we rinsed the slides by washing buffer ( $3 \times 5 \mathrm{~min}$ ) and dried by centrifugation and then used for further binding assay of mAb.

Figure S3. Microarray (glyco)peptides slides, schematic microarray printing on chamber slide (left panel) and printing pattern of each compound group (right panel).

Microarray mAb binding assay. The following buffers and solutions were used in this section: Buffer for the solution of mAb: 50 mM Tris- $\mathrm{HCl}, 100 \mathrm{mM} \mathrm{NaCl}, 1 \mathrm{mM} \mathrm{CaCl} 2$, $\mathrm{MnCl}_{2}, \mathrm{MgCl}_{2}, 0.05 \%$ Tween-20, $0.1 \% \mathrm{BSA}, \mathrm{pH} 7.4$. Washing buffer: 50 mM Tris-HCl, $100 \mathrm{mM} \mathrm{NaCl}, 1 \mathrm{mM} \mathrm{CaCl} 2, \mathrm{MnCl}_{2}, \mathrm{MgCl}_{2}, 0.05 \%$ Triton X-100, pH 7.4. For the mAb incubation, $20 \mu \mathrm{~L}$ of mAb solution in buffer (mAb concentration: $50.0 \mu \mathrm{~g} / \mathrm{mL}$ ) was carefully added onto each chamber of slides and they were kept at r.t. for 2 h on humid conditions. Next, slides were washed with washing buffer ( $3 \times 2 \mathrm{~min}$ ) and dried up by centrifugation. For the analysis of the binding, secondary Ab (Cy3-labeled Ab) was diluted to $1 \mu \mathrm{~g} / \mathrm{mL}$ in buffer and infused between hybridization covers and slides. After standing at r.t. for 1 h at dark, slides were washed by different methods (stated for each case): (a) washing buffer ( $3 \times 2 \mathrm{~min}$ ) and dried up by centrifugation; (b) previous method (a) followed by washing buffer ( $2 \times 2 \mathrm{~min}$ ), water washing ( $2 \times 2 \mathrm{~min}$ ) and dried up by centrifugation. To storage the slides, they were degassed under vacuum and kept at $4^{\circ} \mathrm{C}$. Slides were subjected to fluorescent image scanning on a Tryphoon Trio Plus instrument (GE Healthcare). Array Vision software was used to quantify the fluorescence of each spot. The median value of relative fluorescence intensity (RFU) was used; spot intensities were determined by subtracting the average pixel intensity from the median pixel intensity of the local background within the spots. Fluorescence
of each spot is shown as the average of four replicate spots used to construct histograms showing the antibody-binding profile. As statistical analysis, Grubbs method was used to discriminate the outliers. Error bars are included showing the standard deviation for each peptide-mAb interaction. Results of the two anti-MUC1 mAbs at $50.0 \mu \mathrm{~g} / \mathrm{mL}$ are illustrated in Figures S4 and S5.

Figure S4. Binding assay with antibody SM3 ( $50.0 \mathrm{ug} / \mathrm{mL}$ ). Washing method: a. Fluorescent image scan, together with fluorescent response graph is shown. RFU due to the binding of the Cy3-labeled secondary antibody were measured and represented as mean values in a bar chart.

Figure S5. Binding assay with antibody VU-3C6 (50.0 ug/mL). Washing method: b. Fluorescent image scan, together with fluorescent response graph is shown. RFU due to the binding of the Cy3-labeled secondary antibody were measured and represented as mean values in a bar chart.

Crystallization. Expression and purification of scFv-SM3 has been described previously by us. ${ }^{[52]}$ Crystals were grown by sitting drop diffusion at $18{ }^{\circ} \mathrm{C}$. The drops were prepared by mixing $0.5 \mu \mathrm{~L}$ of protein solution, containing $15 \mathrm{mg} / \mathrm{mL}$ of $\mathrm{scFv}-\mathrm{SM} 3$ and 10 mM of $\mathrm{fP}^{* \prime}$ with $0.5 \mu \mathrm{~L}$ of the mother liquor. Crystals of scFv-SM3 with the peptide above were grown in 20\% PEG 3350, 0.2 M disodium hydrogen phosphate. The crystals were cryoprotected in mother liquor containing 15\% ethylenglycol and frozen in a nitrogen gas stream cooled to 100 K.

Structure determination and refinement. The data was processed and scaled using the XDS package ${ }^{[33]}$ and CCP4 software, ${ }^{[54]}$ relevant statistics are given in Supplementary Table S1. The crystal structures were solved by molecular replacement with Phaser ${ }^{[55]}$ and using the PDB entry 1SM3 as the template. Initial phases were further improved by cycles of manual model building in Coot63 and refinement with REFMAC5. ${ }^{[56]}$ The final models were validated with PROCHECK. ${ }^{[57]}$ Coordinates and structure factors have been deposited in the Worldwide Protein Data Bank (wwPDB). PDB id: 5OWP, see also Table S2.

Table S1. Data collection and refinement statistics. Values in parentheses refer to the highest resolution shell. Ramachandran plot statistics were determined with PROCHECK.

Figure S6. Electron density maps are $\mathrm{F}_{\mathrm{O}}-\mathrm{F}_{\mathrm{C}}$ syntheses (blue) contoured at $2.2 \sigma$ for glycopeptide $\mathbf{f P}^{* \prime}$. The amino acid residues and the GalNAc moiety are colored in blue and green, respectively. The fluorine atom is in magenta. It is important to note that Pro at the C -terminal region could not be resolved.

DFT calculations. Full geometry optimizations were carried out with Gaussian $09^{[88]}$ using the M06-2X hybrid functional ${ }^{[s 9]}$ and $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set. Bulk solvent effects were not considered in the calculations. Frequency analyses were carried out at the same level used in the geometry optimizations.

Molecular dynamics (MD) simulations on glycopeptides $\mathbf{P}^{* \prime}, \mathbf{f P}^{* \prime}$ and 2fP*' in complex with scFv-SM3. The crystal structure of glycopeptide APD-TGaINAc-RP in complex with scFv-SM3 (PDB ID: 5A2K) was used in the MD simulations. Each complex was then immersed in a water box with a $10 \AA$ buffer of TIP3P water molecules. ${ }^{[510]}$ The simulations were carried out with AMBER 16 package ${ }^{[S 11]}$ implemented with ff14SB, ${ }^{[12]}$ GAFF ${ }^{[513]}$ and GLYCAM06j ${ }^{[S 14]}$ force fields. The parameters and charges for the unnatural amino acids were generated with the antechamber module of AMBER, using GAFF force field and AM1-BCC method for charges. ${ }^{[515]}$ A two-stage geometry optimization approach was performed. The first stage minimizes only the positions of solvent molecules and the second stage is an unrestrained minimization of all the atoms in the simulation cell. The systems were then gently heated by incrementing the temperature from 0 to 300 K under a constant pressure of 1 atm and periodic boundary conditions. Harmonic restraints of $30 \mathrm{kcal} \cdot \mathrm{mol}^{-1}$ were applied to the solute, and the Andersen temperature-coupling scheme was used to control and equalize the temperature. The time step was kept at 1 fs during the heating stages, allowing potential inhomogeneities to self-adjust. Long-range electrostatic effects were modelled using the particle-mesh-Ewald method. ${ }^{[S 16]}$ An 8 Å cut-off was applied to Lennard-Jones interactions. Each system was equilibrated for 2 ns with a 2 fs time step at a constant volume and temperature of 300 K. Production trajectories were then run for additional 200 ns under the same simulation conditions.
$\mathbf{p}^{* \prime}: S M 3$ (scFv)

2fP*':SM3 (scFv)

Figure S7. Distance distribution Pro-Trp96L and Pro-Tyr32L obtained from 200 ns MD simulations for glycopeptides $\mathbf{P}^{* \prime}, \mathbf{f P}{ }^{* \prime}$ and $\mathbf{2 f} \mathbf{P}^{*}$ bound to the antibody SM3.

Figure S8. Monitoring of $\phi, \psi$ torsional angles for the glycosidic linkage (GalNAc-Thr) in glycopeptides fP'* and 2fP*' bound to antibody SM3 through the 200 ns MD simulations. The conformational behavior of this glyosidic linkage is similar in both derivatives. The main conformer populated in solution for the glycosidic linkage differs from that observed in the X-ray structure of compound fP*' bound to SM3 (red circle, PDB ID: 50WP).
fP*':SM3 (scFv)

Figure S9. Monitoring of $\phi, \psi$ torsional angles for the backbone of glycopeptides $\mathbf{f P}^{*}$, and 2fP*' bound to antibody SM3 through the 200 ns MD simulations. The red circle represents the $\phi / \psi$ values obtained for the peptide backbone of $\mathrm{fP}^{* \prime}$ in complex with SM3 in the X-ray structure (PDB ID: 50WP).

## Human sera samples

Samples were obtained from Biobanco-iMM, Lisbon Academic Medical Center, Lisbon, Portugal.

Table S3. Age distribution of sera donors used for detection of human circulating antibodies against MUC-1 variants.

| Diagnostic | Age distribution (years) | Number of <br> samples |
| :--- | :--- | :---: |
| Prostatic adenocarcinoma | $65.3 \pm 6.0(\mathrm{p}=0.0947, \mathrm{n} . \mathrm{s}$.) | 9 |
| Prostatic benign hyperplasia | $71.6 \pm 8.1\left(\mathrm{p}=0.0092,{ }^{* *}\right)$ | 11 |
| Male controls | $60.2 \pm 2.5$ | 5 |

## Enzyme-linked Immunosorbent Assays (ELISA) for detection of human circulating antibodies against MUC-1 and synthetic variants

High-binding ELISA plates (JetBioFil, China) were coated with $100 \mu \mathrm{~L}$ of a $20 \mu \mathrm{M}$ solution (in NaPi buffer, pH 7 ) of each MUC variant, and incubated for 2 h at $37{ }^{\circ} \mathrm{C}$. Wells were thrice washed with wash buffer ( $0.05 \%$ Tween-20 in PBS 1x), and then blocked for 1 h at $37{ }^{\circ} \mathrm{C}$ with $100 \mu$ of ELISA buffer ( $1 \%$ BSA in wash buffer). The wells were again washed 3 times with wash buffer, before incubation with sera samples (dilution 1:50 in ELISA buffer), performed at RT, for 90 min. The wells were again washed 3 times with wash buffer, and were incubated with donkey anti human IgG H\&L antibody conjugated to HRP (Abcam, UK) for 1 h at RT (final concentration $300 \mathrm{ng} / \mathrm{mL}$ ). Finally, the wells were washed, and development of the assay was performed. Briefly, $90 \mu \mathrm{~L}$ of $3,3^{\prime}, 5,5^{\prime}$-Tetramethylbenzidine (TMB) 1 x solution (eBiosciences, ThermoFisher Scientific, USA) was added to the wells, and after 10 min at RT, $50 \mu \mathrm{~L}$ of $2 \mathrm{NH}_{2} \mathrm{SO}_{4}$ was added to stop the reaction. Absorbance at 450 nm was read within the next 10 min, using a Tecan Infinite M200 plate-reader. Background absorbance values were subtracted, i.e. absorbance obtained for wells coated with the same MUC variant but incubated only with the secondary antibody. Values were normalized to those obtained for healthy controls. All groups were compared to $\mathbf{P}^{*}$ using Wilcoxon matchedpairs signed rank test; Experimental groups were compared to equivalent Healthy controls using an unpaired T-test with Welch's correction (one-tailed); * $\mathrm{p}<0.05$; ** $\mathrm{p}<0.02$

Table S4. Raw data obtained for detection of circulating human antibodies against MUC-1. Data is shown as absorbance at 450 nm to which the background absorbance value was subtracted (see Methods). "Signal-to-noise" corresponds to the average of absorbance values of each group normalized to the values obtained for "healthy controls" (see Fig. 7 in the main text).

| Diagnostic | Age | Absorbance at 450 nm (corrected for "blank") |  | "Signal-to-noise" ratio |  |
